## THE EMPLOMMENT SITUATION: MAY 1979

Employment rose slightly in May, and unemployment was unchanged, the Bureau of Labor Statistics of the U. S. Department of labor reported today. The Nation's unemployment rate was 5.8 percent, the same as 1 A Aprit; it has been in the 5.7 to 5.9 percent range for the past 10 months.

Total employment-as measured by the monthly survey of households--edged up by 140,000 in May following a very sharp decline in April. At 96.3 million, total employment was 2.4 million higher than a year ago.

Nonfarm payroll employment-as measured by the monthly survey of establishments-rose by 170,000 in May to 88.4 million. Nonfarm payroll jobs have advanced by 2.9 million since Kay 1978. Average weekly hours rebounded somewhat from depressed April levels but were still considerably below March and year-earlier levels.

## $\xrightarrow{\text { Unemployment }}$

Both the unemployment rate, 5.8 percent, and the number of unemployed, 5.9 million, were the same as in April, and have remained near the levels which have prevalled since August 1978. The May jobless rates for adult men ( 3.9 percent), adult women ( 5.8 percent), and teenagers ( 16.8 percent) were little changed from April and also have not shown much variation since last August. Unemployment rates for whites ( 5.0 percent) and blacks ( 11.6 percent) and most other worker groups were also at or near the levels which have been in evidence over the past several months. (See tables A-1 and A-2.)

## Total Employment and the Labor Force

Total employment advanced very slightly in May ( 140,000 ) to 96.3 million. Because of the large employment decline in April, the May level was still more than half a million below that of March. Because of strong growth in the months prior to April, employment in May was 2.4
million higher than a year earlier. Over-the-year fob gains among adult women were especially pronounced ( 1.5 millifon ); adult men posted an employment advance of 1.0 m 11110 n . Employment among teenagers was down alightly over the year, in part a refiection of their decifinag population. (See table A-1.)

The civilian labor force also advanced very slightly over the month to 102.2 milition and was 2.2 million higher than May 1978. At 63.4 percent, the civilian labor force participation rate was about unchanged from its April level but was dowa 0.5 percentage point from the Pebruary-March all-time high. Participation was up over the year, however, with adult women accounting for all of the fincrease. (See table A-1.)

## Industry Payroll kmployment

Nonfarm payroll employment, at 88.4 million, rose by 170,000 in May following no change in April. The small increase since March was in sharp contrast to the situation during the previous 6 months when employment grew by an average of 350,000 a month.

Among the major industry divisions, only three--construction, transportation and public utilities, and wholesale and retail trade--showed sizeable over-the-month job gains. A 65,000 increase in construction employment was mostly in highway and street construction, probably due to heightened road repair activity resulting from severe winter storms. Despite a May employment grouth of 50,000 stemming from the settlement of the Teamsters strike, transportation and public utilities failed to recoup completely the losses experienced during the previous month, as United Airlines emplojees remained on strike during the reference period. Trade rose by 45,000 over the month, continuing the long-terill uptrend in the industry.

Manufacturing employment in both the durable and nondurable goods industries edged down for the second month in a row, returning to Pebruary levels. In all, fob gains took place in only 48 percent of the 172 industries comprising the blS diffusion index. (See tables B-1 and B-6.) Hours

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls was 35.6 hours in May, up 0.2 hour from the depressed April level, which had been affected by holidays, strike activity, and, perhaps, by unusual weather conditions. The April decline of half an hour was not matched by the May increase, and, among the major goods-producing industry divisions, only the mining workweek was as high as its March level. Construction (down 0.9 hour from March), durable goods manufacturing (down 0.7 hour), and nondurable goods (down 0.5 hour) did not rebound completely from their severe April decline in hours. Overtime hours in manufacturing--3.4 in May--followed essentially the same pattern as the regular workweek during the March-May period.

Among the service-producing industries, only transportation and public utilities showed a workweek pattern similar to that of the goods-producing industries; hours were up 0.4 in May but still were 0.5 below their Karch level. Average hours in the other service-producing industries did not follow the same pattern over the past 2 months. (See table B-2.)

With the combination of small increases in both employment and weekly hours, the index of aggregate weekly hours of production or nonsupervisory workers rose 1.0 percent in May but remained about the same magnitude below March's record high of 124.7 (1967-100). The Index was 3 percent above the year-ago level. (See table B-5.)

## Hourly and Weekly Earnings

Average hourly earnings of production or nonsupervisory workers on private nonagricultural payrolls rose 0.7 percent from April and were 8.2 percent above the May 1978 level (seasonally adjusted). Average week1y earnings were up 1.2 percent over the month and have risen 7.3 percent from the year-earlier level.

Before adfustment for seasonality, average hourly earnings rose 5 cents to $\$ 6.07,45$ cents above May 1978. Average weekly earnings were $\$ 215.49, \$ 4.19$ above April and $\$ 14.86 \mathrm{~h}$ igher than a year earliter. (See table B-3.)

## The Hourly Earnings Index

The Hourly Earnings Index--earnings adjusted for overtime in manufacturing, seasonality, and the effects of changes in the proportion of workers in high wage and low-wage industries--was 227.1 (1967-100) in May, 0.1 percent higher than in April. The index was 7.6 percent above May a year ago. During the 12 -month period ended in April, the Hourly farnings Index in dollars of constant purchasing power declined 2.5 percent. (See table B-4.)

Explanatory Note

This release presents and analyzes statistics from wo major surveys. Data on labor force, total employment, and unemployment (A tables) are derived from households which is conducted by the Bureau of the Census for the Bureau of Labor Statistics. Beginning in september 1975, the sample was enlarged by 9,000
mouseholds in order to provide greater reliability for smaller States and thus permit the publication of annual statistics for all 50 States and the District of Columbia. These supplementary households were added to the ,000 national household sample in January 1978; thus elected to represent the U.S. civilian noninstitutional population 16 years and over.
Statistics on nonagricultural payrol employment, Burs, and earnings (B tables) are collected by the agencies, from payroll records of a sample of approxiagencies, from payrol records of a sample of approxi-
mately 165,000 establishments. Unless otherwise indiated, data for both statistical series relate to the week containing the 12 th day of the specified month.

## Comparability of household and payroll

## mployment statistica

Employment data from the household and payrol surveys differ in several basic respects. The househol survey provides information on the labor force activity
of the entire civilian noninstitutional population, 16 ears of age and over, without duplication. Each person is classified as either employed, unemployed, or not in he labor force. The household survey counts employed ersons in both agriculture and nonagricultural including private household workers), counts the selfemployed, unpaid family workers, and persons "with a job but not at work" and not paid for the period absent.
The payroll survey relates only to paid wage and salary employees (regardiess of age) on the payrolls of more than one job during the survey week or otherwise appear on more than one payroll are counted more than once in the establishment survey. Such persons are counted only once in the household survey and are of hours.

## Unemployment

To be classified in the household survey as
job during the survey week; (2) have made specifi efforts to find employment sometime during the prior
weeks; and (3) be presently available for work. addition, persons on layoff and those waiting to begin new job (within 30 days), neither of whom must mee the jobseeking requirements, are also classified as
unemployed. The unemployed total includes all persons who satisfactorily meet the above criteria, regardless of their eligibility for unemployment insurance benefits or any kind of public assistance. The unemployment rate represents the unemployed as a proportion of the civilian labor combined).

The Bureau regularly publishes a wide variety of labor market measures. See, for example, the demo graphic, occupational, and industry detail in tables A-2
and $A-3$ of this release and the comprehensive data package in Employment and Earnings each month set forth in table A-7. Identified by the symbols U-1 through U-7, these measures represent a range or possible definitions of unemployment and of the labor force-from the most restrictive ( $\mathrm{U}-1$ ) to the mas appears as U-5.

## Seasonal adjustment

Nearly all economic phenomena are affected to some degree by seasonal variations. These are recurring, predictable events which are repeated more
or less regularly each year-changes in weather, openin and elosing of schools, major holidays, industry produc events are often large. For example, of ects of thes the year, they explain about 95 percent of the month-to-month variance in the unemployment figures. Since seasonal variations tend to be large relative to the underlying eyclical trends, it is necessary to use
seasonally-adjusted data to interpret short-term seasonally-adjusted data to interpret short-term
economic developments. At the beginning of each year seasonal adjustment factors for unemployment and other labor force series are calculated for use durin the entire year, taking into account the prior year's experience.

All seasonally-adjusted civilian labor force and unemployment rate statistics, as well as the majo employment and unemployment estimates, are computed by aggregating independently adjusted series is derived by dividing the estimate for total unem
ployment (the sum of four seasonally-edjusted age-sex components) by the civilian labor force (the sum of 12 seasonally-edjusted age-sex components).
For establishment data, the seasonally-adjusted series for all employees, production workers, average by aggregating the seasonally-adjurted data from the ey aggregating the seasonally-adjurted data from the revised annually, often in conjunction with benchmark comprehensive' counts of employment) adjustments. The most recent revision. of seasonally-adjusted data
was based on data through May 1978.)

## Sampling variability

Both the houschold and establishment survey tatistics are subyect to semping error, which should be well as urvey is based upon a probability sample, he results may differ from the figures that would be cotained if it were poomible to take a complate ceansur using the same uestionnaires mad proculues. The standard error is the meaiure of sampling vumbility, that is, of the variation
that oceurs by chance brenuse a sample rather than the that occurs by chance because a sample rather than the out of 100 that an estimate from the survey differs from a figure that would be obtained trrough a A throuete cencus by les than the standard error. Tables A hrough Hi in the "Eaplanatory Notes" of Employment errors for unemploymment and other labor force categories To obtain a 90 -percent level of confidence,
the confidence interval generally used by BLS, the the confidence interval generally used by BIS, the errors should be multiplied by 1.6. The following sampling error: For a monthly change in total em-
ployment, the standard error is on the order of plus or ployment, the standard error is on the order of plus o in total unemployment is approximately 115,000 . The standard error on a change in the national unemploy ment rate is 0.12 percentage point.
Although the relatively large size of the monthly establishment survey assures a high degree of accuracy,
the estimates derived from it also may differ from the figures obtained if a complete census using the same schedules and procedures were possible. However, since the estimating procedures utilize the previous month of employment (link-relative technique), sampling and response errors may accumulate over several months. To remove this accumulated error, the employmen (comprehensive counts of employment) usually on annual basis. In addition to taking account of sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual. establishments. Employment estimates are currently projeeted from March 1977 levels.
estimates for indivicual industries is the root-ment square error (RMSE). The RMSE is the standard devistion -adjusted for. the bias in estimates. If the bias is small, the chances are about 68 out of 100 that an estimate from the sample would differ from its bench-
mark by less than the RMSE. For total nonagriculturat employment, the RMSE is on the order of plus or minus 81,000 . Measures of reliability (approximations of the RMSE) for establishment-survey data and actual amounts of revision due to benchmark adjustments are provided in tables $J$.through $O$ in the "Explanatory Notes" of Employment and Earnings.

peproliminary.
NOTE: All series are in current doflars except where indicated. The index excludes effects of two types of ehanges that are unrelated to underlying wage-rate developments: Fluctuations in overtime premiums in manufacturing (the only sector for which owartime dret are available) and the effects of changes in the proportion of workers in high-wege and low-wege industries.
