## USDL $80-65$ <br> ransmission of material in this release is EMBRRGORY 1, 1980

the employment situation: january 1980

Unemployment rose in January, and there were contrasting developments in employment, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Due to a rise in joblessness among adult men, the Nation's unemployment rate increased over the month from 5.9 to 6.2 percent, the highest rate since July 1978

Total employment-as measured by the monthly survey of households--showed little overall change in January, although there were diverse movements among adult men and women jobholders. Consistent with their rise in unemployment, employment among adult men was down markedly, while the number of adult women holding jobs increased.

In contrast to total employment, nonfarm payroll employment--as measured by the monthly survey of establishments--rose by about 300,000 in January to 90.5 million.

## Unemployment

The number of persons unemployed increased 340,000 in January to 6.4 million. Most of this upturn occurred among persons who were laid off or otherwise lost their last jobs. Over the past year, the jobless total has risen by 610,000 . (See tables A-1 and A-S.)

With the increase in the level of unemployment, the Nation's fobless rate rose three-tenths of a point to 6.2 percent. The jobless rate had remained within the narrow range of 5.7 to 5.9 percent over the prior 17-month period.

The January increase in unemployment was concentrated among adult men; their rate rose from 4.2 to 4.7 percent, the higheat since November 1977. The increase was shared by both black and hite men. In contrast, the rates for adult women ( 5.8 percent) and teenagers ( 16.3 percent) were about unchanged over the month. Strong increases were also registered in the cyclically sensitive unemployment rates for married men, full-time workers, blue-collar workers, and workers in durable goods manufacturing. (See table A-2.)

There was no change in the number of nonfarm workers on part-time work schedules for economic reasons (sometimes termed the "partially unemployed"), following large increases in the last quarter of 1979. (See table A-3.)

Total Employment and the Labor Force
Total employment was little changed in January, but there were offsetting movements among adult men and women. There was a drop of $200,000 \mathrm{in}$ the number of men with jobs, while employment among adult women rose by 170,000 . Employment also fell in the male-dominated blue-collar occupations. Employment was up by 1.7 million from January 1979 , the smallest over-the-year increase since January 1976. (See tables A-1 and A-3.)

The civilian labor force grew by 230,000 from Degember and was up 2.3 millition from a year ago. Adult women accounted for the bulk of these increases. Their labor force participation

Table A. Major indicatpre of labor market activity, geanonally adjuated

rate reached a new high of 51.4 percent, while that of men and teenagers edged down over the month.

## Industry Payroll Employment

Nonfarm payroll employment rose to 90.5 million in January, up 305,000 from the December level. Contributing to this increase was a net reduction in strike activity of approximately 50,000 .

The buik of the January employment growth occurred in the service-producing industries. Gains were registered throughout the sector, with the most sizeable increases in trade $(130,000)$, services $(55,000)$, and transportation and public utilities $(30,000)$.

Within the goods-producing sector, the construction industry posted an employment gain of 65,000 . Overall employment in manufacturing was about unchanged. There was a decline of nearly 60,000 in transportation equipment, due to job cutbacks in automobiles and parts, and swaller decreases in fabricated metal products and food processing. These were about offset by a return of striking workers in the machinery industry, coupled with small increases in several other industries, primarily in the nondurable goods sector. Employment in mining remained near its December level.

Over the past year, payroll jobs have increased by 2.0 million, with 85 percent of the gain occurring in the service-producing sector. (See table b-1.)

## Hours

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls remained at 35.7 hours in January, a level maintained since November. Movements were small and generally offsetting among the major industries. In manufacturing, average hours and overtime both edged up a tenth of an hour to 40.4 and 3.3 hours, respectively. (See table B-2.)

The index of aggregate weekly hours remained at 126.7 (1967-100) in January and has risen by only 1.8 percent since January 1979. The manufacturing index, however, has decreased by 2.2 percent over the past year. (See table B-5.)
Hourly and Weekly Earnings
Average hourly earnings of production or nonsupervisory workers on private nonagricultural payrolls rose 0.3 percent in January and were up 7.4 percent over the year (seasonally adjusted). Average weekly earnings also rose 0.3 percent from December and were 7.1 perceir above the January 1979 level.

Before ad justment for seasonality, average hourly earaings rose 3 cents in January to $\$ 6.41$ and were 44 cents above January 1979. Average weekly earaings were $\$ 224.99$, down $\$ 4.69$ from December but still up $\$ 14.85$ over the year. (See table B-3.)

## The Hourly Earninga Index

The Hourly Earnings Index--earnings adjusted for overtime in manufacturing, seasonality, and the effects of changes in the proportion of workera in high-wage and low-wage industries-was 239.8 (1967-100) in January, 0.2 percent higher than in December. The Index was 7.7 percent above January a year ago. In dollars of constant purchasing power, the Index decreased 4.5 percent during the 12 -month period ended in December. (See table b-4.)

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey the information on the labor force, total employment. and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about $\mathbf{6 5 , 0 0 0}$ households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the $\mathbf{B}$ tables, marked ESTABLISHMENT DATA. This information is collected frate agencies. The sample includes approximately 162,000 establishments employing more than 32 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The dala in this release are affected by a number of fechnicas, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

Coverige, definitions and differences between surveys The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
all as paid civilians; worked in their owd any work profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of iliness, bad weather, disputes between labor and management, or personal reasons.
People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no elpor work at that time: and they made weecific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off
and waiting to be recalled and those expecting to report a job within 30 days.
mployed and the force equals the sum of the number ment rate is the percentage of unemployed peopemploy civilian labor force. Table A-4 presents a special group ing of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathbf{U}-1$, and the most comprehensive yields U-7. The official unemployment rate is U-5.
Unlike the houschold survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural
firms. As a result, there are many differences between the two surveys, , .-.-The household survey, although based
maller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers;
----The household survey includes people on unpaid leave among the employed; the estabishment survey does hot;
--- The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
.-The household survey has no duplication of in in the establishment survey, employees working at once, than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.
Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtain ed from the BLS upon request.

## Sensonal adjustmen

Over a course of a year, the size of the Nation's labo force and the levels of employment and unemploymen as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closin of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.
Because these
Because these seasonal events follow a more or les regular pattern each year, their influence on statistica month to month. These adjustments make nonseasonal developments, such as declines in economic activity or
increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.
Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standa:d error depends upon the size of the sample, the result: of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a comolete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than lit times the
standard error from the results of a complete census. At the 90 -percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minus 293,000; for total unemployment, it is 185,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .23 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 2.75$ per issue or $\$ 22.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables $\mathbf{A}$ through $I$ of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $K$ through $P$ of that publication.

1 The population figures are not adjusted for samonal variations; therefore, identical numbers uppear in the unadjusted and the seasonally adjusted columns.

- These wre the official Buresul of Labor Statistics' astimates used in the administration of Federsl fund allocition programa.

NOTE: The not seasonelly adjusted labor foree estimates for 1979 hew been revined to reflect the latest 1979 population estimates for the States. These revised estimates were used to deviop semenally adjusted data for 1979 and seasonal factors to be used in 10e0, using the X-11/ARIMA mothodology.

[^4]N. $\mathrm{N}_{1}$ = not availabie.
pepreliminary.
NOTE: All series are in current dollars except where indicated. The index excludes effects of two types of changes that are unrelated to underlying wage-rate developments: Fluctuations in overtime premiums in manufacturing (the only sector for which owortime chata are available) and the effects of changes in the proportion of workers in high-wage and low-wege inceatries

Table B-5. Indexes of aggregate weekly hours of production or nonsupervisory workers,' on private nonagricultural payrolls by industry, seasonally adjusted
