## THE EMPLOYMENT SITUATION: JULY 198

Employment rose in July and unemployment declined, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The overall unemployment rate was 7.0 percent, down from the 7.3 percent which prevailed during most of the January-June period.

Total employment--as measured by the monthly survey of households--rose by 570,000 to 99.0 millign. Nonfarm payroll employment-as measured by the monthly survey of establishments-a also fncreased sharply $(385,000)$ over the month. Both employment series have advanced by nearly 2 million from the recession trough of July 1980.

## Unemployment

The number of unemployed persons in July, 7.5 million, and the unemployment rate, 7.0 percent, declined from their June levels. Since July of last year, the fobless level was down by about half a million, and the rate dropped six-tenths of a percentage point. Nevertheless, unemployment remained well above pre-recession levels. (See table A-1.)

Unemployment decreases registered in July were essentially ifmited to men. The jobless rate for men 25 years and over, which had edged up over the previous 2 months, dropped from 5.0 to 4.7 percent, a return to the rate posted in March of this year. The rate for young men 20 to 24 years, which has been rather volatile in recent months, declined sharply and, at 11.3 percent, was at its lowest mark since March 1980.

The rate for adult women in July, 6.7 percent, was ilttle changed, while the rate for teenagers edged down to 18.1 percent. There were also fobless rate declines among both white and black workers.

Joblessness among workers in the construction industry ( 15.0 percent) was still well above the rates that prevailed earlier this year. In contrast, the rate for factory workers was much improved from the begining of the year. (See table A-5.)

The number of job losers (persons on layoff and those permanently separated from their jobs) fell to 3.7 millition in July. Since July 1980, their number has declined by about 640,000 . (See table A-7.)

Long-term unemployment (joblessness of 15 weeks or more) declined in July, as did unemployment lasting 5 to 14 weeks. The average (mean) duration of unemployment edged down to 13.9 weeks. (See table A-6.)

Table A. Major Indicators of labor market activity, seasonally adjusted

Total Employment and the Labor Force
Total employment rose by 570,000 over the month on a seasonally adjusted basis to 99.0 million, a return to the April level. Most of the over-the-month gain took place among adult men, particularly those 20 to 24 years old. There was also an increase among teenagers, while employment of adult women was unchanged. Since last July's trough, total employment has increased by 1.9 million, with all of the increase accounted for by adult men and women. In contrast, employment of teenagers was 550,000 below their year-ago level, in part reflecting the declining population for this group. (See table A-1.)

The civilian labor force rose by 290,000 in July. Over the past year, the labor force has grown by 1.4 million, about in line with the population increase. Thus, the overall participation rate was unchanged over the year, although the participation rate for adult women rose, while those for adult men and teenagers declined. The reduction in participation among teenagers was particularly marked--3 full percentage points.

Industry Payroll Employment
The number of employees on nonagricultural payrolls rose 385,000 to 92.0 miliion in July (seasonally adjusted). This was the largest over-themonth increase in the now year-long recovery period. Payroll job increases have totaled nearly 2.0 million since the year-ago low, with nearly all industry groups posting job gains. Construction and government were the exceptions to this trend. (See table B-1.)

Employment in the construction industry remained at depressed levels in July, as an additional 20,000 jobs were lost. In contrast, employment in manufacturing, which has shown improvement in recent months, rose by 110,000 to 20.5 million. Both durable and nondurable goods industries exhibited job increases in July, with fabricated metals, machinery, electrical equipment, and apparel showing the most improvement. Mining continued to rebound from its strike-affected levels of a few months ago, posting a 30,000 job gain in July.

After declining in the previous month, employment in the service-producing sector rose by 265,000 in July. Retail trade and services were each up by 85,000 , while State and local government, which had declined over the past several months, was up by nearly 75,000 . Employment in Federal government and transportation and public utilities each showed little change for the second consecutive month. Finance, insurance, and real estate continued to grow, increasing by 15,000 in July.

## Hours of Work

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls, at 35.3 hours, was unchanged in July. The factory workweek was down 0.1 hour to 40.0 hours; factory overtime, at 2.9 hours, was also down a tenth of an hour. Both factory total and overtime hours were up substantially over the past year, however. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls, at $109.5(1977=100)$ in July, was 0.6 percent above the June figure and 3.4 percent above last July's low point. The manufacturing index rose 0.5 percent over the month to 100.7; the index was up 6.1 percent from last July. (See table B-5.)

Hourly and Weekly Earnings
Both average hourly and weekly earnings of production or nonsupervisory workers on private nonagricultural payrolls rose 0.4 percent in July (seasonally adjusted). Before adjustment for seasonality, average hourly earnings increased 3 cents to $\$ 7.23,59$ cents above the year-earlier level. Average weekly earnings were $\$ 256.67$, up $\$ 1.79$ from June and $\$ 22.28$ from July 1980. (See table B-3.)

## The Hourly Earnings Index

The Hourly Earnings Index (HEI) was 138.9 (1977=100) after seasonal adjustment in July, an increase of 0.4 percent over the previous month. For the 12 months ended in July, the increase before seasonal adjustment was 8.8 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI decreased 0.5 percent before seasonal adjustment during the 12 -month period ended in June. (See table B-4.)

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 166,000 establishments employing about 35 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off
and waiting to be recalled and those expecting to report to a job within 30 days.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the civilian labor force. Table A-4 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$, and the most comprehensive yields U-7. The official unemployment rate is U-5.

Unilike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
----The househcld survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers;
----The household survey includes people on unpaid leave among the employed; the establishment survey does not;
----The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
----The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or
increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.
Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the
standard error from the results of a complete census. At the 90 -percent level of confidence--the confidence limits used by BLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 279,000; for total unemployment it is 194,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true"' level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 2.75$ per issue or $\$ 22.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathbf{M}, \mathbf{P}, \mathrm{Q}$, and $\mathbf{R}$ of that publication.

## HOW YOU CAN HELP REDUCE THE COST OF GOVERNMENT

As part of our effort to cut the cost of government, the Bureau of Labor Statistics is seeking to reduce mailings at public expense.

If you have been receiving releases in this series, but do not need future issues, please sign and return this page which bears your address label.

Thank you for helping to reduce the cost of government.

JANET L. NORWOOD
Commissioner
Bureau of Labor Statistics

Please discontinue sending releases in this series to the address shown on the mailing label.
