or solicit coments about information in this release.
the employment sttuation: august 1981
Thi enploynent situation was little changed in August, the Bureau of Labor Statistics of the U.5. Department of Labor reported today. The overall unemployment rate was 7.2 percent, conpared with 7.0 percent in July. During most of the January-June period, the jobless rate had bean 7.3 percent.

Following substantial increases in July, employment, as measured both by the monthly surveys of households and establishments, held about steady in August. Since July 1980's recession trough, both employment series have risen by about 2 million

## Unemploynent

The unemploynent rate in August, 7.2 percent, and the number of unemployed persons, 7.7 million, were up slightly from July. Patterns differed, however, among certain worker groups. For example, the rate for young men 20 to 24 years, which has exhibited considerable volatility slace April, rose sharply in August and, at 12.7 percent, returned to the June level. In contrast, unemployment among $20-24$ year-old women has shown little movement in recent months, and, at 10.8 percent, the rate was unchanged from July. Among workers 25 years and over, the Jobless rate for men ( 4.8 percent) also was little different over the month, while that for women ( 5.5 percent) inched down. Among teenagers, the rate for blacks ( 45.7 percent) increased substantially, whereas unemployment of white teenagers ( 15.6 percent) was not much different fron July. This large rise in black teenage unemployment contributed to a marked fincrease in the overall jobless rate for black and other workers to 15.0 percent. (See tables A-1, A-2, and A-8.)

The nunber of unemployed persons who lost their last jobs rose in August; all of the increase was among those whose employment had been permanently terminated. The number of persons on layoff was unchanged over the month but was almost half a million below the level in August 1980. (See table A-7.)

The nurber of persons unemployed 1 to 3 months increased in August, as did those jobless 6 months or more. The average (mean) duration of unemployment went up to 14.5 weeks, about the level that had prevailed at the beginning of the year. (See table A-6.)

Table A. Major indicators of labor market activity, seasonally adjusted

## Total Employment and the Labor Force

Total employment, at 98.9 million, was unchanged over the month, after adjustment for seasonality. There was, however, a decrease in the number of employed black teenagers and an increase among white teens. Since the recession trough, total employment has increased by 1.9 million, with all of the increase accounted for by adult men and women.

The civilian labor force was unchanged in August at 106.6 million. The labor force has grown by about 1.6 million over the past 12 months. The participation rate of adult women was up over the year, while participation of adult men and teenagers declined.

## Industry Payroll Employment

Nonfarm payroll employment in August held at the July level of 92.0 million. The job count has expanded by 2.1 million since the recession low. Only construction and government among the major industry divisions posted declines over this period. (See table B-l.)

In the goods-producing sector, there was a continuation of growth in the mining industry, especially in oil, gas, and coal extraction. In construction, employment was unchanged after declining between April and July; the industry has failed to rebound since last year's low, due in large part to the tight money market which has kept interest rates high and the construction of residential housing low. Employment in manufacturing, which had been at depressed levels since last year's recession but had shown signs of improvement in recent months, remained at about the July level. Factory employment has yet to recover fully from the devastating losses in the auto industry from mid-1979 on through the 1980 recession. Over-the-month movements in Individual manufacturing industries were generally small and offsetting. There was, however, a decline of 30,000 in food processing plus a reduction of 10,000 in lumber and wood products. On the positive side, machinery continued to show growth with a gain of 15,000 jobs.

In the service-producing sector, there was an employment increase of 60,000 in retail trade, while employment in Federal government decreased by 35,000 over the month.

## Hours of Work

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls in August was 35.3 hours, up 0.1 hour from July. Manufacturing hours also edged up a tenth of an hour, as did factory overtime hours. All three workweek measures have shown little
movement in recent months, though total factory hours and overtime were up over the past year. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls rose 0.2 percent in August to $109.5(1977=100)$. The manufacturing index was little changed over the month. The two indexes were up by 2.7 and 4.4 percent, respectively, fron August 1980. (See table B-5.)

Hourly and Weekly Earnings
Average hourly earnings of production or nonsupervisory workers on private nonagricultural payrolls rose 1.0 percent in August, while average weekly earnings posted a slightly larger increase, 1.3 percent (seasonally adjusted). Before adjustment for seasonality, average hourly earnings rose 6 cents in August to $\$ 7.30,63$ cents above the year-earlier level. Average weekly earnings were $\$ 259.88$ in August, $\$ 2.86$ above July and $\$ 23.09$ above August 1980 . The Hourly Earnings Index

The Hourly Earnings Index (HEI) was 140.6 (1977=100) after seasonal adjustment in August, an increase of 1.1 percent over the previous month. For the 12 months ended in August, the increase (before seasonal adjustment) was 9.2 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements-miuctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI decreased 1.7 percent (before seasonal adjustment) during the 12 -month period ended in July. (See table B-4.)

Chart 2. Unemployment rate--all civillan workers

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 166,000 establishments :employing about 35 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off
and waiting to be recalled and those expecting to report to a job within 30 days.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the civilian labor force. Table A-4 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$, and the most comprehensive yields U-7. The official unemployment rate is U-5.
Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
----The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers;
----The household survey includes people on unpaid leave among the employed; the establishment survey does not;
----The household survey is limited to those 16 years of age and older; the establishment survey is not-limited by age;
----The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.
Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.
Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or
increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.
Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.
The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the
standard error from the results of a complete census. At the 90 -percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minus 279,000; for total unemployment it is 194,000; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.
Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 2.75$ per issue or $\$ 22.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A ciheck or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{P}, \mathrm{Q}$, and R of that publication.

1 Data relate to production workers in mining and manufacturing; to construction workers in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employment on private nonagricultural payrolls.

This series is not seasonally adjusted since the seasonal component is small relative to th trend-cycle and/or irregular components and consequently cannot be separated with sufficien precision.
$p=p$ reliminary .

## HOW YOU CAN HELP REDUCE THE COST OF GOVERNMENT

As part of our effort to cut the cost of government, the Bureau of Labor Statisfics is seeking to reduce mailings at public expense.

If you have been receiving releases in this series, but do not need future issues, please sign and return this page which bears your address label.

Thank you for helping to reduce the cost of government.

JANET L. NORWOOD
Commissioner
Bureau of Labor Statistics

Please discontinue sending releases in this series to the address shown on the mailing label.
