## ISDANSMISSION of Material in this release is mbargoed mitil 9:00 A.M. (EST), FRIDAy

 VOVEMBER 6,1981> Advance copies of this release are made available to the press with the explicit understanding that, prior to 9 a.m. Eastern time : (1) Wire services will not move over thetr wires copy based on infornation in this release, (2) electronic media will not feed such information to member stations, and (3) representatives of news organizations will not mentact anyone outside the Bureau of Labor Statistics to ask questions or solicit comments about information in this release

## The emplomment situation: october 1981

Unemployment rose sharply in October, and nonfarm payroll employment declined, the Bureau of abor Statistics of the U.S. Department of Labor reported today. October's unemployment rate as 8.0 percent, up from 7.5 percent in September and the 1981 low of 7.0 percent in July.

Nonfarm payroll employment--as measured by the monthly survey of establishments--fell by 200,000 in October to 91.7 million. Total employment--derived from the monthly survey of ouseholds--was about unchanged at 98.2 million, after declining markedly in September

## nemployment

The Nation's unemployment rate rose 0.5 percentage point to 8.0 percent in October, higher than the rates of 7.6 percent recorded during the 1980 recession. The number of unemployed ersons increased by 550,000 in October to 8.5 million. Though this increase was widespread, it was particularly sharp among adult men, whose jobless rate rose from 6.2 to 6.7 percent. (Se table A-1.)

Unemployment rates rose markedly in October for teenagers (20.6 percent), whites ( 6.9 percent), and full-time workers ( 7.7 percent). There were swall over-the-nonth increases for adult women ( 7.0 percent) and black and other workers ( 15.5 percent), though both groups have had substantial increases since the summer. For the second straight month, a sizeable rise in unemployment took place among blue-collar workers, whose october rate of 11.0 percent was at its highest point ihis year but still slightly below 1980 highs. In a related development, there

## - 2

were marked over-the-month increases in joblessness for workers in the construction an manufacturing industries. (See tables $A-2$ and $A-5$.)

The over-the-month rise in the number of unemployed resulted from increases in both the number of persons on layoff and those returning to the labor force after a period of absence (reentrants to the labor force). Because of the substantial increase in the number of newly unemployed workers (less than 5 weeks), the median duration of unemployment declined from 7.0 to 6.7 weeks in October. (See tables A-7 and A-6.)

The number of nonfarm workers on part-time schedules for economic reasons (sometimes termed the "partially unemployed") rose by nearly half a million to a record 5.0 million in October.

Table A. Major indicators of labor market activity, seasonally adfusted

Over the past 2 months, their total has risen by 840,000 , with substantial increases posted among both those whose full-time workweek was reduced and persons working part time because they couldn't find full-time jobs. (See table A-3.)

Total Employment and the Labor Force
Following a drop of nearly 700,000 in September, total employment was unchanged in October at 98.2 million, as a decline among adult men and teenagers was offset by an increase among adult women. Virtually all of the August-September employment decline took place among women. The overall employment-population ratio was 58.0 percent in October, its lowest level in almost 4 years. (See tables $A-1$ and $A-2$.

The civilian labor force rose by 500,000 to 106.7 million in October, with the entire increase taking place among adult women. Their participation rate, which had declined substantially the month before, moved back up to 52.3 percent.

The labor force rose by 1.5 million over the past year, a somewhat slower pace than in recent times. Increases occurred among adult women ( 1.4 million) and adult men ( 600,000 ), while the number of teenage workers decreased by nearly 500,000 . The teenage reduction stemmed from both a declining population and reduced participation. In line with recent trends, the participation rate of adult women was up by almost a full percentage point over the year, while that of adult men declined. Industry Payroll Employment

Total nonagricultural payroll employment declined by 200,000 over the month to 91.7 million in October. Following 2 months of little change in the number of payroll jobs, the October drop was the first decrease since July 1980. Employment declines were pervasive, as gains were registered in only one-third of the 172 industries comprising the BLS diffusion index of private nonfarm employment. (See tables B-1 and B-6.)

The largest employment drop in October was in manufacturing, which declined by 275,000 . Like total payroll employment, factory employment had held fairly steady during the prior 2-month period. Two-thirds of the over-the-month decrease took place in the durable goods industries, especially in transportation equipment, primary and fabricated metals, electrical equipment, and lumber and wood products. The sharp cutback in transportation equipment
jobs--85,000--actually represented a cumulation of job losses since June. A seasonally-adjusted estimate of these losses could not be made in the intervening months because of the traditional changeover to the automobile industry's new model year. Among the nondurable goods industries, large employment declines occurred over the month in food processing, textiles, apparel, and rubber and plastic products.

Elsewhere in the goods-producing sector, construction jobs dropped by 20,000 , but the decline would have been larger were it not for the settlement of a strike. Mining employment was virtually unchanged, after posting substantial gains during the summer months.

The service-producing sector as a whole registered an advance of 90,000 , although sizeable gains took place only in the services industry and retail trade. The services industry has posted monthly increases continually for 6 years.

Over the past 12 months, the number of nonfarm payroll jobs increased by 1.1 million. Nearly 1 million of this increase occurred in the service-producing sector.

## Hours of Work

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls, at 34.9 hours in October, failed to return to the August level following a decline of 0.3 hour in September that was due, at least in part, to the occurrence of the Labor Day holiday in the survey's reference week. The manufacturing workweek edged up by 0.1 hour in October to 39.4 hours, following a 0.7-hour decline in September. Over the 2 -month period, hours declined in every manufacturing industry. Factory overtime, at 2.7 hours in October, increased by 0.1 hour over the month but was down 0.3 hour over the 2 -month period. (See table B-2.)

Reflecting the October reduction in employment, the index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls-a comprehensive measure of employment and hours effects--dropped by 0.3 percent in october to 108.3 (1977=100). The decline in the index has been continuous since July, totaling 1.0 percent over the 3-month period. The manufacturing index fell by 3.7 percent over the same time span. (See table B-5.) Hourly and Weekly Earnings

Because weekly hours were unchanged in October, both average hourly and weekly earnings posted the same over-the-month change-an increase of 0.3 percent, seasonally adjusted. Before
adjustment for seasonality, average hourly earnings moved up 2 cents in October to $\$ 7.41,56$ cents above the year-earlier level. Average weekly earnings, at $\$ 259.35$ in October, were up 70 cents over the month and $\$ 17.54$ over the year. (See table B-3.)

The Hourly Earnings Index
The Hourly Earnings Index (HEL) was 141.6 (1977=100) after seasonal adjustment in October, an increase of 0.2 percent over the previous month. For the 12 months ended in October, the increase (before seasonal adjustment) was 8.4 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements-fluctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI decreased 1.4 percent during the 12 -month period ended in September. (See table B-4.)

## Revisions to Household Data Series

Effective with data for January 1982, population counts derived from the 1980 Decennial Census will be introduced into the estimation procedures used in the Current Population Survey. Data for 1980 and 1981 will be revised based on the new census population estimates. Provisional adjustments in the major data series for 1979 back to 1970 will also be made and will be introduced with the release of January 1982 data.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Lajor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 166,000 establishments:employing about 35 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off
and waiting to be recalled and those expecting to report to a job within 30 days.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the civilian labor force. Table A-4 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$, and the most comprehensive yields U-7. The official unemployment rate is U-5.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
----The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers;
----The household survey includes people on unpaid leave among the employed; the establishment survey does not;
----The household survey is limited to $t^{\text {th }}$ ose 16 years of age and older; the establishment survey is not limited by age;
----The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.
Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or
increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.
The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the
standard error from the results of a complete census. At the 90 -percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minu 279,000; for total unemployment it is 194,000 ; and, or the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 3.25$ per issue or $\$ 28.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A ciheck or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{P}, \mathrm{Q}$, and R of that publication.

## HOW YOU CAN HELP REDUCE THE COST OF GOVERNMENT

As part of our effort to cut the cost of government, the Bureau of Labor Statisfics is seeking to reduce mailings at public expense.

If you have been receiving releases in this series, but do not need future issues, please sign and return this page which bears your address label.

Thank you for helping to reduce the cost of government.

> JANET L. NORWOOD
> Commissioner
> Bureau of Labor Statistics

Please discontinue sending releases in this series to the address shown on the mailing label.

[^0]:    The population and Armod Forcas figuras are not sdjuntad for sach

[^1]:    1 The population figures are not adjustud for manol varimbions; therefore, identical numbers eppeer in the unedjusted and the seaconelly edfusted colvonne.

    - These we the official Bureas of Labor Statetics' estimpine used in the administration of Federal fund allocation programs.

[^2]:    1 Data relate to production workers in mining and manufacturing; to construction workars in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. Them groups account for approximately four-fifths of the total employment on private nonagricultural payrolis.

[^3]:    2 This series is not seasonally adjusted since the seasonal component is small relative to the trend-eycle and/or irregular components and consequently cannot be separated with sufficient pracision.
    $p$ ppretiminary.
