523-1944 (202)523-1913 TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 9:00 A.M. (EST), FRIDAY,

523-1208

MARCH 5, 1982

Advance copies of this release are made available to the press with the explicit understanding that, prior to 9 a.m. Eastern time: (1) Wire services will not move over their wires copy based on information in this release, (2) electronic media will not feed such information to member stations, and (3) representatives of news organizations will not contact anyone outside the Bureau of Labor Statistics to ask questions or solicit comments about information in this release.

### THE EMPLOYMENT SITUATION: FEBRUARY 1982

Unemployment rose in February and employment remained near January levels, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The Nation's jobless rate returned to the December level of 8.8 percent after declining to 8.5 percent in January.

Total employment--as derived from the monthly survey of households--was 99.6 million in February, about the same as in the prior 2 months. Nonfarm payroll employment -- as derived from the monthly survey of establishments--was 90.9 million, also about unchanged from January but down somewhat from the December level. Since the pre-recession peak of last July, the two employment series have declined by 1.3 million and 950,000, respectively.

### Unemployment

The number of unemployed persons in February, at 9.6 million, was up 280,000 over the month, after declining by a similar magnitude in January. The jobless total was 1.8 million above the July 1981 level. February's jobless rate was 8.8 percent, equaling the December figure and up from last July's low of 7.2 percent.

Adult women accounted for most of the February increase in unemployment. An over-the-month rise of 0.4 percentage point brought their jobless rate to 7.6 percent, the same as that for adult men. Both white and black women shared in the unemployment increase. Overall unemployment rates for white and black workers returned to their December levels of 7.7 and 17.3 percent, respectively. There was also increased joblessness among white-collar and part-time Unemployment rates for most other worker groups, including adult men, teenagers (22.3 percent), Hispanics (12.6 percent), blue-collar workers (12.5 percent), and workers in the construction (18.1 percent) and manufacturing industries (10.6 percent) showed little or no change. (See tables A-1, A-2, and A-5.)

The February rise in unemployment reflected an increase in the number of persons who left their last job and those who returned to the labor force after a period of absence. The number of workers on layoff fell for the second consecutive month but remained half a million above the July level. (See table A-7.) Workers who have been unemployed for 3 months or more increased in number in February, and the average (mean) duration of joblessness lengthened to 14.1 weeks. (See table A-6.)

The number of persons working part time for economic reasons (sometimes referred to as the "partially unemployed") rose by nearly half a million over the month to a record 5.6 million. Nearly all of the increase was attributable to persons who usually work full time. (See table

Digitized for FRASER) http://fraser.stlouisfed.org/ Federal Reserve Bank of St. Louis - 2 -

#### Total Employment and the Labor Force

Total employment was at the 99.6 million level for the third consecutive month, after declining by 1.3 million between July and December. Virtually all of this drop took place among adult men and teenagers. The employment-population ratio (the percentage of the population employed) continued to edge down and in February was 57.3 percent; the percentage has declined 1.2 percentage points since last July to its lowest level in 4-1/2 years.

The civilian labor force returned to the December level of 109.2 million and was up by only 1.3 million over the year. Adult women comprised the bulk of this gain. (See table A-1.)

#### Industry Payroll Employment

Total nonagricultural payroll employment was about unchanged in February at 90.9 million, seasonally adjusted, following 4 months of decline. Employment losses continued to occur in

Digitized for FRASER http://fraser.stlouisfed.org/ Federal Reserve Bank of St. Louis - 3 -

many industries, however, as over-the-month job gains were registered in less than half of the 172 industries comprising the BLS diffusion index of nonagricultural payroll employment. (See tables B-1 and B-6.)

Manufacturing employment fell by about 45,000 in February; this contrasts with declines of more than 200,000 in each of the previous 4 months. The February from was evenly divided between the durable and nondurable goods industries. Among durables, small declines continued the employment downtrend in most industries, including machinery, primary metals, and fabricated metals, while employment rose slightly in transportation equipment. Transportation equipment jobs had dropped by 185,000 between September and January. In nondurable goods, the largest decrease occurred in rubber and plastics.

Elsewhere in the goods-producing sector, construction employment, which had been severely depressed in January because of especially bad weather conditions, rose by about 80,000 in February. This increase, however, was not large enough to erase the January decline, and construction employment was down by about 45,000 over the 2-month period. Mining jobs edged down for the second month in a row.

In the service-producing sector, retail trade rose in February by about 60,000, following an even larger increase in the previous month; however, these advances may be related to lighter than usual pre-Christmas hiring, and hence the post-Christmas reduction in jobs was less than seasonally expected. Since October, employment in retail trade was up by a modest 25,000. After pausing in January, the services industry job count resumed its upward course, rising by about 55,000 in February. Employment in government—which has been losing jobs over the past year—decreased by about 40,000 over the month, with reductions occurring at both the Federal and the State and local levels.

#### Hours of Work

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls rose by seven-tenths of an hour in February, following a weather-related decline of the same magnitude in January. The manufacturing workweek, at 39.1 hours, was up 0.1 hour over the 2-month period, as a 1.8-hour February increase slightly exceeded the January drop. Factory overtime held steady in February at 2.3 hours. (See table 8-2.)

Reflecting principally the over-the-month increase in the length of the workweek, the index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls rose by 2.3 percent in February to 106.5 (1977=100), while the manufacturing index was up by 4.8 percent. Both indexes remained below their December levels. (See table B-5.) Since July, the overall index has dropped by 2.7 percent and the factory index has fallen by 9.1 percent.

#### Hourly and Weekly Earnings

Average hourly earnings edged up 0.1 percent in February, while average weekly earnings rose 2.2 percent, seasonally adjusted. Before adjustment for seasonality, average hourly earnings were down I cent in February to \$7.54, 48 cents above the year-earlier level. Average weekly earnings, at \$260.88, rose \$5.69 over the month and \$13.78 over the year. (See table B-3.)

#### The Hourly Earnings Index

The Hourly Earnings Index (HEI) was 145.1 (1977=100) in February, seasonally adjusted, 0.1 percent higher than in January. For the 12 months ended in February, the increase (before seasonal adjustment) was 7.5 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements—fluctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI increased 0.2 percent during the 12-month period ended in January. (See table 8-4.)

## **Explanatory Note**

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 166,000 establishments: employing about 35 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

#### Coverage, definitions and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off

and waiting to be recalled and those expecting to report to a job within 30 days.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the civilian labor force. Table A-4 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields U-1, and the most comprehensive yields U-7. The official unemployment rate is U-5.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- ----The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers:
- ---The household survey includes people on unpaid leave among the employed; the establishment survey does not:
- ----The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
- ---The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

#### Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually vields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

#### Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At the 90-percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minus 279,000; for total unemployment it is 194,000; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks—comprehensive counts of employment—against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

#### Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in *Employment and Earnings*, published each month by BLS. It is available for \$3.75 per issue or \$31,00 per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables M, P, Q, and R of that publication.

NOTE: Vietnam-era veterans are males who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are males who have never served in the

Armed Forces; published data are limited to those 25 to 39 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population

<sup>&</sup>lt;sup>1</sup> Data relate to production workers in mining and manufacturing; to construction workers in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonagricultural payrolls.

<sup>&</sup>lt;sup>a</sup> This series is not published seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.
p = preliminary.

<sup>\*</sup> See footnote 1, table B-2.

Percent change was .2 from January 1981 to January 1982, the latest month available.

Percent change was .8 from December 1981 to January 1982, the latest month available.

Mining is not seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision. N.A. = not available
