TRANSMISSION of Material in this release Is Embargoed until 8:30 A.M. (EST), FRIDAY, APRIL 2, 1982

> Advance copies of this release are made available to the press with the explicit understanding that, prior to 8:30 A.M. Eastern time (1) Wire services will not move over their wires copy based on information in this release, (2) electronic medta will not feed such information to member stations, and (3) representatives of news organizations will not contact anyone outside the Bureau of Labor Statistics to ask questions or solicit comments about information in this release.

## the emplomment situation: march 1982

The overall employment situation continued to show weakness in March, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The Nation's unemployment rate rose Statistics
from 8.8 to 9.0 percent, equaling the rate of May 1975 .

Nonfarm payroll employment--as derived from the monthly survey of establishments--declined
220,000 over the month to 90.8 million. Payroll jobs have declined by $1,2 l 1110$. by 220,000 over the month to 90.8 million. Payroll jobs have declined by 1.2 million since reaching a high of 92.0 million last September. At 99.5 million, total employment--as derived
from the monthly survey of households-was little different from the levels of the prior 3 from the monthly survey of households--was little differ
months but well below the pre-recession peak of last summer.
Unemployment
The Nation's unemployment rate was 9.0 percent in March, up 0.2 percentage point over the month and 1.8 points since the July 1981 pre-recession low. The number of
280,000 over the month to 9,9 million, 2 million above last July's level.

The March rise in unemployment occurred among adult men and women, whose jobless rates were once again identical at 7.9 percent. The rate for men equaled last December's high, while that for women was still somewhat below 1975 levels. The increase in unemployment affected both
white ( 7.9 percent) and black ( 18.0 percent) workers, whereas the incidence of joblessness among Hispanics and teenage workers was about unchanged at 12.7 and 21.9 percent, respectively. (See tables $A-1$ and $A-2$.)

Joblessness among white-collar ( 4.8 percent), blue-collar ( 12.9 percent), and full-time ( 8.9 percent) workers was up over the month. The jobless rate for workers in wholesale and retail
trade rose from 9.0 to 10.3 percent, while rates for workers in the construction and manufacturing industries were about unchanged. (See table A-5.)

All of the over-the-month increase in joblessness was among job losers, most of whom were permanently terminated from thetr jobs. The number of persons on layoff (fob losers expecting
recall) rose slightly, following 2 months of decline. Job losers have accounted for nearly all of the increase in unemployment since the recession began and in March comprised over 57 percent of the unemployed. (See table A-7.)
The number of persons out of work for 15 weeks or more increased by 230,000 over the month;
average (mean) duration was about unchanged at 14 weeks, while median duration rose to 7.6 weeks. (See table A-6.)

The number of persons in nonagricultural industries working less than 35 hours for economic reasons rose by 150,000 in March to a high of 5.7 million. This represented an Increase of 1.7 million from last June's 1981 low. Most of the over-the-month increase took place among persons
norking Total Employment and the Labor Force

Total employment was liftle changed for the third consecutive month and, at 99.5 million in March, was 1.4 million below last July's level. The percentage of the population employed--the
employment-population ratio-continued to recede, as employment falled to keep pace with employment-population ratio--continued to recede, as employment fanled to keep pace with
population growth. The March ratio was 57.2 percent, 1.6 percentage points below its May 1981 pre-recession peak.

The civilian labor force edged up to 109.3 million in March. The labor force grew by only 1.1 million over the year; adult women accounted for most of this relatively small gain. (See table A-1.)

Table A. Major inditcators of labor market activity, seasonally adjusted

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unempioyment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of abou 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation 166000 atis. 35 166,000 eople
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey dif ferences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, deinitions and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each per son in a household is classified as employed, mployed, or not in the labor force. Those who hold which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business o profession or on their own farm; or worked 15 hours of more in an enterprise operated by a member of thei amily, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, and management, or personal reasons.
People are classified as unemployed, regardless o heir eligibility for unemployn of the following criteria They had no employment during the survey week; the were available for work at that time; and they made pecific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed ar persons not looking for work because they were laid of
and waiting to be recalled and those expecting to report to a job within 30 days.
The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the civilian labor force. Table A-4 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields U-1, and the most comprehensive yields U-7. The official unemployment rate is U-5.
Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
maller sample reflects a larger seement of the popula tion; the establishment survey excludes arriculture the elf-employed, unpaid family workers, and private household workers household workers
eave and survey includes people on unpaid leave among the employed; the establishment survey does not;
----The household survey is limited to those 16 years by age;
...-The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.
Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter he job marke. The checu of sach year for erample seasonality may account for as much as 95 percent of the moth unemployment.
Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or
increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is iikely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more activity.

Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components, and the oficial unemployment rate is derived by dividing the resuluing estimate of total unemployment by the civilian labor The
The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a comcedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the
tandard error from the results of a complete cencus. At the 90 -percent level of confiderice-the confidence limits used by BLS in its analyses-the error for the monthly minus 279,000 . for total unemployment it is 194,000 and for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather hat the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts. Sampling more than these amounts.
when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule the smaller the estimate, the larger the samplin error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smatler than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is 24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in form in Decern. To rer and Nors thild up over ime a co meen. To ducted a establish new benchmarks--comprehensive counts of employment-against which month-to-month changes can be measured The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensiv tatistics are contained in Employment and Earning per issue or $\$ 31100$ per year from the U.S. Governmen Printing Office, Washington, D.C. 20204. A check o money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey dara published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision $\mathrm{M}, \mathrm{P}, \mathrm{Q}$, and R of that publication.

NOTE: Vietnam-era veterans are males who served in the Armed Forces between August 5. 1964 and May 7. 1975. Nonveterans are males who have never served in the

Armed Forces: published data are limited to those 25 to 39 years of age, the group that most closely corresponds to the bulk of the Vietnamera veteran population.

Table A-11. Persons not in labor force by reason, sex, and race, quarterly averages

[^0]Personal factors include "employers think too young or ald," "7acks educition or trining," and
3 Inclutes emall number of men not looking for work beceuse of home rasponsibilition

- Data relate to production workers in mining and manufacturing; to construction workers in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonagricultural payrolls.
? This series is not published seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision. $p=$ preiminary.
