the employment situation: july 1982
Unemployment increased in July, and employment remained near June levels, after seasonal adjustment, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Th

Total employment--as derived from the monthly survey of households-was about unchanged in July at 99.7 million. Nonfarm payroll employment--as derived from the monthly survey of
establishments--also was little changed, but employment continued to decline in manufacturing. Since the July 1981 pre-recession peak, total and nonfarm payroll employment have decined by 1.1 and 1.6 million, respectively.

## Jnemployment

The number of unemployed persons rose by 360,000 in July to 10.8 million, seasonally adjusted. Since July 1981, the jobless total has increased by 2.9 million persons. At 9 percent, the overall unemployment rate was up 0.3 percentage point from June and 2.6 points over the year. (See table A-1.)

Over-the-month increases were concentrated among adult women and teenagers, whose rates reached 8.4 and 24.1 percent, respectively. While the rate for adult men, 8.8 percent, wa month. Amehanged over the month, it was above the rate for adult women for the third consecuct 3.7 percent, while rethnic groups, the unemployment rate for white workers was up 0.3 point unchanged over the month. The rate for black teenagers remained at about 50 percent. (Se ables A-1 and A-2.)

Increased joblessness among women and teenagers was also reflected in higher unemployment among new entrants and reentrants to the labor force. The number of workers on layoff wa unchanged in July, while the number of other job losers declined. (See table A-7.)

Average duration of unemployment declined over the month, as the July increase nemployment occurred among the short-term unemployed (those unemployed less than 5 weeks). The mean duration of unemployment decilned almost one week to 15.6 weeks, while the median was down one and a half weeks to 8.3 weeks. (See table A-6.)

## Total Employment and the Labor Force

Total employment rose about in ine with seasonal expectations in July and, at 99.7 millio fter seasonal adjustment, was about unchanged from the June level. Over the year, tota employment was down by 1.1 million. The proportion of the population employed in July was 57 . percent, about the same as in the previous month but 1.4 points lower than the July 1981 level (See table A-1.)

The civilian labor force, which has shown considerable volatility in recent months, rose by the labor force was up by a slightly larger decline in June. At 110.5 million persons in July, this increase and adult men rose by 800,000 ; the teenage labor force declined, reflecting both reduced labor force participation and a decine in the size of their population
Industry Payroll Employment
Total nonagricultural payroll employment was about unchanged in July at 89.8 million, following a June decline of 300,000 (as revised). July job gains in the service-producing sector largely offset continued employment declines in the goods-producing industries. Since July 1981, the number of nonfarm jobs has declined by 1.6 million, as only one-fifth of the i86 the

In the goods-producing sector, employment declined over the month in manufacturing an mining, while construction was about unchanged. Cutbacks in machinery accounted for almost half
of the 90,000 manufacturing employment decline. Employment in machinery has fallen by 100,000 in the last 2 months alone. The food processing and apparel industries also registered sizeabi reductions, while smaller declines continued the long-term downtrends evident in most of the other manufacturing industries. In all, manufacturing jobs were down by 1.5 milliion over the past year. Over this same period, job losses in mining and construction totaled 320,000

Among the service-producing industries, services posted an employment gain of 55,000 Despite the recession, the services industry has grown by 450,000 jobs in the past year. In addition, there were smaller increases in trade and government. In contrast, employment in trans.

## Hours of Work

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls edged upward 0.1 hour in July to 34.9 hours, seasonally adjusted. Average hours it factory workweek has risen for 3 straight months but was still 0.7 hour below the level of year earlier. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on privat onfarm payrolls rose 0.1 percent in July to $105.0(1971=100)$. The manufacturing adex decline Hourly and Weekly Earnings

Average hourly earnings increased by 0.5 percent in July, while average weekly earnings rose 0.8 percent, seasonally adjusted. Before adjustment for seasonality, average hourly earning t $\$ 269.98$, were up $\$ 2.93$ over the month and $\$ 12.24$ over the year. (See table B-3.)

## The Hourly Earnings Index

The Hourly Earnings Index (HEL ) was 148.7 (1977-100) in July, seasonally adjusted, 0.4 percent higher than in June. For the 12 months ended in July, the increase (before seasona adjustment) was 6.9 percent. The HEI excludes the effects of two types of changes unrelated t underiying wage rate movements--fluctuations in overtime in manufacturing and interindustry
employment shifts. In dollars of constant purchasing power, the HEI increased 0.1 percen
during the 12 -month period ended in June. (See table B-4.)

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 177,000 establishments employing about 36 million people

For both surveys, the data for a given month are ac cually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 h , which may or may not correspond irectly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey dif ariace in results between a survey of a sample and ef the population. Each of these factors explained below.

Coverage, definitions and differences between surveys The sample households in the household survey are selected so as to reflect the entire civilian noninstitu tional population 16 years of age and older. Each per in a household is classified as employed nemployed, or not in the labor force. Those who hold ore than one job are classified according to the job a which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also cunted as employed if they were on unpaid leav because of illness, bad weather, disputes between labo and management, or personal reasons.
People are classified as unemployed, regardless of Heir eligibility for unemployment benefits or public assistance, if they meet all of the following criteria They had no employment during the survey week; they were available for work at hat time, and they mad pecific efforts to find employment sometime during th prior 4 weeks. Also included among the unemployed ar ersons not looking for work because they were laid of
and waiting to be recalled and those expecting to report to a job within 30 days.
The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the civilian labor force. Table A-4 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most
restrictive definition yields U-1, and the most comprehensive yields U-7. The official unemployment rate is U-5.
Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
...-The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers;
---The household survey includes people on unpaid leave among the employed; the establishment survey does not;

The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
...-The household survey has no duplication of individuals, because each individual is counted only once; in the estat lishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.
Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a as 95 percent of the month-to-month changes :n unemployment.
Because these seasonal events follow a more or eess regular pattern each year, their influence on statistical rrends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or
increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the
standard error from the results of a complete census. At the 90 -percent level of confidence-the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minus 279,000; for total unemployment it is 194,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 3.75$ per issue or $\$ 31.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

- The population figures are not adjusted for seasonal variations; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.

NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

| - Data relate to production workers in mining and manufacturing; to construction workers in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonagricultural payrolls. <br> - This series is not published seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision. $\mathrm{p}=\text { preliminary. }$ |  |  |  |  |  |  |  |  |  |  |
