transmission of material in tiis release is EMBARGOED UNTIL 8:30 A.M. (EST), FRIDAY, NOVEMBER S, 1982

> Advance copies of this release are made available to the press with the explicit understanding that, prior to $8: 30$ A.M. Eastern time: (1) Wire services will not move over their wires copy based on information in this release, (2) electronic media will not feed such information to member stations, and (3) representatives of news organizations will not contact anyone outside the Bureau of Labor Staristics to ask questions or solicit commen:s about information in this release.

## THE ERFLOYMENT SITUATION: OCTOBER 1982

Unemployment rose in October and employment declined after adjustment for seasonality, tho Bureau of Labor Statistics of the U.S. Department of Labor reported today. The Nation's unemployment rate increased from 10.1 to 10.4 percent over the month and was substantially ahove the July 1981 pre-recession low of 7.2 percent.

Total employment-as measured by the monthly survey of households--fell by 630,000 in October to 99.1 million. Noafarni payroll employment--as measured by the monthly survey of establishments--dropped by 265,000 to 88.9 million, as job losses continued in durable goods manufacturing.

## Unemployment

The number of unemployed persons rose by 290,000 in october to 11.6 million, seasonally adjusted, following an increase of 450,000 in the previous month. Since July 1981, unemployment has risen by 3.7 million , with virtually all of the increase occurring among persons laid off or permanently separated from their jobs. Persons who have lost their jobs now account for over 63 percent of total unemployment, compared with about 50 percent in July a year ago. (See tables A-1 and A-7.)

The overall unemployment rate, at 10.4 percent in October, was 0.3 percentage point higher than in September. The rate has increased fairly steadily over the past 15 months froma pre-recession low of 7.2 percent. Nearly all of the October rise in joblessness occurred among adult men and women, whose rates reached 9.8 and. 8.6 percent, respectively; the rate for teenagers was about unchanged at 24.5 .ircent. The increase for adult workers was reflected in higher unemployment rates for married men ( 7.6 percent), married women ( 7.9 percent), and full-time workers ( 10.5 percent). Among race-ethnic groups, the unemployment rate for white workers rose to 9.3 percent, while rates for 1 ifspanics and blacks, at 15.2 and 20.2 percent, respectively, remained at record levels. Virtuallyevery worker group has posted substantial increases in unemployment from their pre-recession levels. (See tables A-I, A-2, and A-5.)

The average (mean) duration of unemployment rose over the month to 17.2 weeks, as the nuber of long-term unemployed (those jobless 15 weeks or more) continued to increase. Median duration was about unchanged at 9.6 weeks, after rising in September. (See table A-6.)

The number of nonfarm workers on part-time schedules for economic reasons held about steady at 6.6 million in October, following a sharp rise in September. This nuber wat 2.2 million above the July 1981 level. (See table A-3.)

Total employment dropped by 630,000 in October to 99.1 million, seasonally adjusted. Since July 1981, employent has dropped by 1.8 million, and the proportion of the population employed, at 56.6 percent in October, has declined by almost 2 full percentage points. Declines in the ratio occurred among all three major age-sex groups but were sharpest asong adult men and teenagers.

The civilian labor force declined by 340,000 in october to 110.6 million, seasonally adjusted, following an increase of the same magnitude a month earlier. Over the year, the labor force expanded by 1.5 million persons, with adult women accounting for 1.0 miliion of the gain and adult men another 850,000. A labor force decrease for teenagers of 375,000 stemed primarily from a declining population. (See table A-1.)

Industry Payroll Employment
Nonagricultural payroll employment declined by 265,000 in October to 88.9 million, after seasonal adjustment. Since July 1981, the number of nonfarm jobs has fallen by 2.5 million. Most of the over-the-month cutbacks were in the goods-producing sector, especially in the durable goods manufacturing industries where employment dropped by 200,000. (See table B-1.)

Among the durable goods industries, the most sizable losses occurred in the five major metal and metal-using industries-machinery, primary metals, fabricated metals, transportation equipaent, and electrical equipment. Within nondurable goods, several industries registered small employment declines. Manufacturing employment was down 230,000 over the month and 2.0 million since July 1981. Jobs in mining and construction also continued to decline.

Employment in the service-producing sector was litcle different from September, as changes among the component industries were generally small and offsetting. There was, however, a continued reduction in trade, where job losses have totaled 180,000 in the past 3 months.

## Hours of Work

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls, at 34.7 hours in October, seasonally adjusted, edged down 0.1 hour over the month. The factory workweek was unchanged at 38.7 hours, after having dropped by half an hour between July and September. Factory overtime was down 0.1 hour to 2.2 hours in October. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls declined 0.6 percent in October to 103.2 (1977=100). The manufacturing index dropped 1.8 percent over the month to 83.9 and has declined by 16 percent since July 1981 . (See table B-5.)

## Hourly and Weekly Earnings

Average hourly earnings increased 0.4 percent in october, while average weekly earnings edged up by 0.1 percent, seasonally adjusted. Before adjustment for seasonality, average hourly earnings rose 2 cents to $\$ 7.78$, 36 cents above the y $\in$ ar-earlier level. Average weekly earnings, at $\$ 270.74$, were up 69 cents over the month and $\$ 9.56$ over the year. (See table B-3.)

## The Hourly Earnings Index

The Hourly Earnings Index (HEI) was 150.6 (1977=100) in October, seasonally adjusted, 0.4 percent higher than in September. For the 12 months ended in October, the increase (before seasonal adjustment) was 6.1 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements-fluctuations in overtime in maufacturing and interindustry employment shifts. In dollars of constant surchasing power, the HEI increased 1.2 percent during the 12 -month period ended in September. (See table B-4.)

## Explanatory Note

This news release presents statiatics from two major surveys, the Current Popmetaion Survey (homehold survey) and the Current Employment Samistics Sarvery (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the $\mathbf{A}$ tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 houscholds that is conducted by the Burenu of the Census with most of the findings amalyzed and pablished by the Bureau of Labor Stmistics (BLS).

The ectablishment survey provides the information on the employment, hours, and earmines of morkers on monagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample inctudes approcimately 177,000 establishments employing about 36 million people.

For both surveys, the data for a civen month are actually collected for and relate to a particular week. H the household survey, unless otherwise indicmed, it is the calendar week that compins the 12 th day of the month, which is called the sarvey week. In the extablishmient hurvey, the reference week is the pary pariod including the 12 th, which may or many not correspond directly to the calendar week.
The data in this release are affected by a momber of technical factors, inchoding defimitions, sarvey differences, seasonal adjustrients, and the incuitsble variance in results between a survey of a sample and a census of the entire popmation. Ench of these factors is explained below.

The sample houscholds in the houschold sarvey are selected so as to reflect the entire civilian momintimtional population 16 years of age and odder. Exch persom in a homsehold is classified as exployed, unemployed, or not in the habor force. Those who hold more than one job are classified according to the job at which they worked the moat hours.

People are chasified as emproyed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprive operated by a mensber of their family, whether they were paid or not. People wre aloo counted as employed if they were on minpid lanve because of illmess, bad weather, dispites between libor and management, or personal remoms.

People are chasified as memployed, regariless of their eligibility for unemploymena benefitis or public assistance, if they meet all of the followine criveria: They had mo employment durine the smervey week; they were available for work at that time; and they mede specific efforts to find employment cometime during the priof 4 weeks. Also inchaded ansong the unemployed are persoms not looking for work because they were hid off
and writing to be recolled and those expecting to report to a job withia 30 days.

The civilime Lhbor force equals the sume of the E maber employed and the rember tracmployed. The manaploymever rate is the percemame of amenployed people in the civelin labor force. Tible A-4 presents a specing erouping of sevel mensures of termploymex beed on verying definitions of uremplogment and the libbor force. The defimitions are provided in the table. The most restrictive definion yields U-1, and the mont comprelvensive gialds U-7. The officiol memploynete rate is U-S.

Unitise the monsilold survey, the exablindmeneat survey only connts wate and sallary eipiloyees whowe mases appenr ou the pagnoll records of momericithan fins. As a resk, there are many differcuces between the two surveys, tinoms which ere the following:
-The homochold sirvey, shitoudl based on a

increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force . ch June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of civilian labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the official unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the
standard error from the results of a complete census. At the 90 -percent level of confidence-the confidence limits used byibLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 279,000; for total unemployment it is 194,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.

In the establishment survey, estimates for the $\mathbf{2}$ most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 6.00$ per issue or $\$ 39.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A ciheck or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

- The population figures are not adjusted for seasonal variations; therefore, identical numbers appear in the unadjusted and seasonaliy adjusted columns.

NOTE: Detail for the above race and Hispanic-origin groups will not sum to totale because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

NOTE: Vietnam-era veterans are males who served in the Armed Forces between August 5. 1984 and May 7, 1975. Nonveterans are males who have never served in the

Armed Forces; published data are limited to those 25 to 39 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteitan pepulation.
