THE ERPLOMMENT SITUATION: JANUAEX 1983.
Unemployment declined in January after seasonal adjustaent, and the number of nonfarm jobs Increased, the Bureau of Labor Statistics of the U.S. Departant of Labor reported today. A new overall unemployment rate which includes the resident Araed Forces in the labor force, introduced torment rate for all civilian workers was 10.4 percent, down froa 10.8 parcent in December.

Total employment was unchanged in January, at 100.8 million, seazonally adjusted. Both civilian employment-ras measured by the monthly urvey of householda-and the resident Armed Forces ( 1.7 million) were unchanged over the month.

Nonfarm payroll employment-as measured by the monthly aurvay of eatablishents-rose by 340000 in January, after seasonal ad justanent, with trade and construction accounting for mos of the increase. In addition, both the total private and factory workweks advanced sharply.

## Unemployment

The number of unemployed persons increased by leas than uaval from December to January, and, as a reaule, the seasonally adjusted leval decinned by 90,000 to 10.4 aillon. The unemployment rate for all civilian workers decreased by 0.4 percen 1981 pre-recession 10 . However, th
table A-2.)

Among the major demographic groups, the rates for adult men ( 9.6 percent), teenagers (22.7 percent), and whites ( 9.1 percent) fell over the month, while the rates for adult women ( 9.0 percent), blacks ( 20.8 percent), and Hispanics ( 15.5 percent) were about unchanged. Jobles rates also declined over the wonth among workers in manufacturing and construction-the two industry groups that have been most severely affected by the recesiion. (See tables A-2, A-3 and A-6.)

SER

The civilian labor force fell by 580,000 in Jamuary to 110.5 adilion, seasonally adjusted. Adult men accounted for about two-thirde of the reduction. The civilian labor force hae Industry Payroll Paployent

Nonagricultural payroll eaployment was 88.9 inilion in Jamuary, seasonally adjusted, up 340,000 from the December 1982 leval. Over-the-month gains were concentrated in retail trade ( 240,000 ) and construction ( 115,000 ). The seasonally adjusted increases for both industriea were the reault of maller-than-utual eaployment deciines from Deceaber to January. Some of the seasonally adjusted increase in retail trade caploynent occurred because hiring for the 1982 staff were less than expected. The increase in construction post-hoinday reductions in sales unumally gild weather that prevailed throughout much of the Nation in Jafuary, the recent upturn in housing starts, and the already reduced employment levels.

Manufacturing employaent held steady in January after declining throughout the course of the recession. The mubber of workers on wachinery payrolls fell by about 20,000; eaployment changes In this industry usually lag behind those in other namufacturing industries. Elsewhere, eaployment in finance, insurance, and real estate rose by nearly 30,000 , while government
 (See table B-1 )

## Bours of Work

The average workweek of production or nonsupervisory workers on private nonfara payrolls rose by 0.4 hour in January to 35.2 hours, seasonsily adjusted. While factory overtime hours remained unchanged, the manufacturing workweek vas up 0.8 hour over the month. The average
workweek increased substantially in industries ilnked to housing construction--luaber, furniture, and stone, clay and glase products-and also rose markediy in transportation equipuent, textiles, and apparel. (See table B-2.) These gains may be overstated to soae extent because of the impact of the severe winter weather of January 1982 on the seasonal adjustanent process.

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolla was up 1.8 parcent, seasonally adjusted, in January to 104.4 (1977-100). The manfacturing index, at 85.0 , mas up 2.3 percent over the month but remained

## Hourly and Heekly Earninge

Average hourly earnings increased by 0.4 percent in Jamuary, but, as a reault of the longer average workwek, average weekly carnings rose by 1.5 percent, seasonally adjuated. Before adjuscrent for seasonality, average hourly earnings of $\$ 7.89$ were up 7 cents over the month and 34 cents over the year. Average weekly earnings, at $\$ 273.78$, rose 8 cente over the month and $\$ 17.83$ from year carlier. (See table b-3.)

## The Hourly Earninge Index

The Bourly tarninga Index (ABI) was 152.7 (1977=100) in January, seasonally adjuated, 0.4 percent higher than in December. Por the 12 monthe eaded in January, the increase (before seasonal adjustment) was 5.4 percent. The HBI excludes the effects of two types of changes unrelated to underiying wage rate novements--fluctuations in overtime in manufacturing and interindustry employnent shifts. In dollars of constant purchasing powe

## Revisions in the Household Survey Data

Effective with the releace of data for Jamuary 1983, eqveral modifications have been made In the presentation, clasalfication, and eatianting procedures of national labor force data derived from the Current Population Survey (CPS). In addition to the traditional civilian series, the BLS is publishinp new labor force aeries that inciude persons in the Armed Forcen
stationed in the United States; all occupational and industry data are coded sccording to the clasaification syateas used in the 1980 censua; and the CPS firat-stage ratio estination procedure incorporates 1980 rather than 1970 census population veighta.

## Inclusion of the Resident Armed Porces

In its 1979 report, Counting the Labor Porce, the National Comission on Bmployment and Unemployment Statistics recommended that menbers of the Armed Forces stationed in the United States be included in the national labor force statistics. This recomsendation was subsequently accepted by the Secretary of Labor in his final report to the Congress on the comiseion's recoumendations, dated October 1981. Accordingly, members of the resident Armed Forces are total overall unemployment rate. They are also included in the totals for nen and women 16 rears and over. (See table A-1.) The new overall uneuployment rate is one- or two-tentha of a percentage point lower than the civilian based rate, and the rate for men is lower by a alightly larger margin; the rate for woaen is essentially unaffected. Data on the resident Armed Forces, Hich are obtained froa the Defense Department, do not provide the demographic, social, and econoaic detail that are available from the CPS for civilian workers, and thus the publication and analitan basis vast majority of employment and unemployment statistics uill continue to

## Conversion to the 1980 Census Occupation and Industry Classification Syatems

All occupational and industry data derived froa the CPS are now based on 1980 census classification systems rather than the 1970 census eystems used aince January 1972. All occupational data are coded according to the classification system used in the 1980 census,
which evolved from the 1980 Standard Occupational Classification systen. The new industriai classifications are based on the 1972 Standard Industrial Clasnification syetem (SIC), as modified in 1977. While the conversion had little effect on industry-related data, the new occupational categoriea are so radically different that their impleaentation represents a break in historical data series.

To assist users in bridging the gap between the two occupational classification systeas, the Census Bureau has coded a 20 -percent semple of the 1982 microdata files for selected months convert the 1982 occupational data to the new classification. (See table A-il.) The methodology convert the 1982 occupational data 198 is only reliable at the aggregated level, and thus data by sex, race, or other characteristics are not being produced. Seasonal adjustment of occupationsl data based on the 1980 clasaification syatem will not be possible until at least 5 yeare of data becose avallable.

## Reviaion of Estinating Procedure:

A CPS estimation procedure-under which adjustants are wade to take into account the ifferences existing at the time of the most recent census betwen the race-reaidence distribution for the Nation and for the smple areas-now nakes use of the 1980 census results. The differences between the old and new procedures are negligible for the nost part. However, che change resulted in an increase of about 120,000 in the estinate of the actiopolitan area opuldition, this nes procedure yields a slight increase in the eatinated unesploynent rates for black women, and the eatinated nuaber of persons eaployed in agriculture. A discussion of these changes appeared in "habor force data from the CPS to undergo revision in January 1983", Honthly Labor Review. Noveaber 1982, pp. 3-6. A more current and detailed explanation will appear in "Revisions in the Current Population Survey Beginaing in January 1983" in the Fabruary 1983 issue of Elployent and Earainga.

## Explanatory Note

 This news release presents statistics from two major surveys,the Current Population Survey (household survey) and the the Current Population Survey (houschold survey) and the
Current Employment Statisics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLs in cooperation with State agencies The sample includes approximately 180,000 estab lishments employing about 36 million people.
For both survey, the data for a given month are actually collected for and relate to a particular week. In the houschol contains the 12 th day of the month, which is called the surver week. In the ertablishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, sessonal ad justments, and the inevitable variance in results between a survey of a semple and a census of the entire population. Each of these factors is explained below.

Coveraje, defialtions and differences between surveys
The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of ase and older. Esch person in a houschold is classified as employed, unemployed, or not in the labor force. the job at which they worked the most hours.
People are clasified as employed if they did
as paid civilinns; worked in their own business or profersion or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illiness, bad weather, disputes be tween labor and management, or personal reasons. Member of the Armed Forces stationed in the United Siates are also in cluded in the employed total.
People are classified as unemployed, regardless of their eligibility for unemployment benefits or publi assistance, if they meet all of the following criteria: They had no employment during the survey week; they were availabl for work at that ume; and they made specinc efforis io find employment somelime durns he pion weeks. Abs for wort amons the where hid off and waiting to be recalled and thoce expecting to report to a job within 30 days.
The labor force equale the sum of the num
the number unemployed. The unemployment cote is the percentige of unemployed people in the labor force (civilina plus the resident Armed Forces). Table A-S presents a special
grouping of seven measures of unemployment based on vary ing definitions of unemployment and the labor force. The definition yieds $U-1$, and the most comprehensive vietds $U-7$ The overall unemployment rate is U. Sa, while U. Sb represent the same measure with a civilian labor force base.
Unlike the houschold survey, the eatablishment survey only counts wase and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
-The houschold survey, although based on a smaller sam ple, refiects a larger segment of the popalation; the catablish ment survey excludes agriculture, the self-employed, unpaid family workers, private houschold workers, and members of the rexident Anmed Forces;
among the employed; the extablishment gurvey unpaid leav - The housebold surver is lisited to surver does not, and older; the exablishment survey is not limited by ate: and older; the establishment survey is not limited by age; because each individual is counted only once: in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in Comparing Employment Exumates from Houschoid and Payroll Surveys," which may be obtained from the BLS upon request

## Sencomal adjurtmen

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment underto sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major ple, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may accounges in as momoyment
Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonscasonal developments, such as declines in economic activity or incresess in the participation of women in the labor force, easier to spor. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changea mine if the levd of economic activity hes rieen or declined However because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.
Measures of labor force, employment, and unemploymen contain components such as age and sex. Statistics for all
employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally ad justed either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore for the labor force is the sume seasonally adjusted figure civilian employmett components, plus the resident Amed Forces total (not adjustod for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment componenis; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal ad justments are recalculated reguiariy. For the houschold survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along at the end of the next section.

## Sampling vartabuity

Statistics based on the houschold and establishment surveys are subject to sampling error. that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household sus of stan amount of the differences can be expressed in error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an esimes the standard error from the results of a complete census. At the 90 -percent level of confidence-the confidence limits used by BLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 279,000 ; for total unemployment it is 194,000; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these
magnitudes but, rather, that the chances are 90 out of 100 that the 'true" level or rate would not be expected to differ from the estimates by more than these amounts.
Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error the unemployed the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .24 percentage point; for teenagers, it is 1.06 percentage points.
In the establishment survey, estimates for the $\mathbf{2}$ most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up
over time, a comprehensive count of the employed is conover time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establoyment - beinst which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

Adinlonal stansics and other information
In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is availabie for $\$ 6.00$ per issue or $\$ 39.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out 1o the Suprihe Emplocit and Earnings also aldes aps.
Employment and Earnings also provides approximations of this release. For unemployment and other labor force categories, the standard errors appear in tables B through $\mathbf{J}$ of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $M, O, P$, and $Q$ of that publication.

## BLS News Releases Avallable Electronically

The Bureau of Labor Statistics has inaugurated an electronic news release service that permits persons interested in the Bureau's national economic indicators to gain access directly from the computer in which they are stored.
Cost of the electronic news releases, which can be transmitted over telephone lines to computer terminals and t other remote access devices anywhere in the world, ranges from $\$ 5$ to $\$ 15$ per release, plus the cost of the telephone call.
National bls releases available on-line, immediately upon official release of the data to the public, include:

Employment Situation
Commissioner's statement before the Joint Economic Committee
Producer Price Indexes
State and Metropolitan
Area Employment
and Unemployment Consumer Price Index Real Earnings Productivity and Costs Employment Cost Index

BLs will continue to make its releases available to the press in the conventional manner. But, news organizations and others now have the option of accessing the releases electronically.
BLs also makes its data available in periodicals published by the Bureau and sold by the Government Printing Office; on computer tape, sold by bls; and in some instances, via Mailgram and in microform.

Information about electronic news releases and about BLS data in other forms is available from the Office of Publications, Bureau of Labor Statistics, Washington, D.C. 20212.

A recorded summary of is available 24 hours a day on principal CPI, PPI, and Em- (202) 523-9658. ployment Situation numbers

[^0]:    

[^1]:    - Persons with no previous work experience are included in the unemployed totel.
