TRANSMISSION of Material in this release is grabargoed ontil 8:30 A.m. (EDT), friday, JUNE 3, 1983

## ThE EMPLOMENT SITUATION: MAY 1983

Enployment rose in May and unemployment was 1ittle changed, the Bureau of Labor Statistics of the U.S. Department of Labor announced today. The overall unemployment rate, which includes the resident armed forces in the labor force base, was 10.0 percent, compared with 10.1 percent In April. The rate for civilian workers was 10.1 percent. Both measures have declifned seven-tenths of a percentage point from last December's highs.

The number of persons on nonagricultural payrolls--as measured by the monthly survey of establishments-rose by 375,000 in May to 89.5 mililion. Particularly atrong growth took place in consiruction, manufacturing, and services. (Establishment data have been revised to reflect March 1982 benchmark adjustments and updated seasonal factors--see note on page 3.)

## Unemployment

The number of unemployed persons, 11.2 million, and the unemployment rate for civilian workers, 10.1 percent, were near April levels after adjustment for seasonalicy. Both figures continued to register gradual decilines from their December highe of 12.0 milition and 10.8 percent, respectively.

Virtually all worker groups showed little change in their rates of unemployment from April to May. The rate for adult men edged down from 9.8 to 9.6 percent. Joblessness among adult women was about unchanged, at 8.5 percent, as was the rate for teenagers, at 23.0 perate fate 8.9 percent for white workers. (See tables A-2 and A-3.)

There was a decline in the number of workers who had been uneaployed for 5 to 14 weeks, but also a small rise in foblessness of 15 weeks or more. The median duration of unemployment rose over the month by 1 week to 12.3 weeks, while the mean duration rose by 1.4 weeks to a new high of 20.4 weeks. (See table A-7.)

## Civilian Employment and the Labor Force

Civilian employment-as measured by the survey of households-was little changed in May at 99.6 million, seasonally adjusted, following a relatively large increase in April. Since reaching a recession low of 99.1 million last December, employment has risen by nearly half a million, with adult men ( 370,000 ) and adult women ( 270,000 ) accounting for the increase.

At 110.7 million, the civilian labor force was about unchanged from April, seasonally adjusted. Since last May, the civilian labor force has grown by only 400,000. However, adult menage population and labor force participation produced a 700,000 reduction in their labor force number.

## Industry Payroll Employment

Total nonagricultural payroll employment rose by 375,000 in May to 89.5 million, seasonally adjusted. Payroll jobs have risen by 650,000 in the last 2 months and 800,000 since December. Eaployment increases were widespread for the second month in a row, with 70 percent of the industries in the BLS index of diffusion registering gains in May. (See tables b-1 and b-6. The construction industry, which was hard hit by the recession, added 80,000 jobs in May,
following a small increase in April. Manufacturing employment, which had also been severely
limpacted by the recession, rose by 105,000 for the second consecutive month. These increases were paced by strong advances in the five major metals and metal-using industries as well as the three industries associated with the construction industry-lumber, furniture, and stone, clay, and glass. Most of the increase in machinery jobs, however, was due to the return to work of strikers.

Bmployment in services continued to expand briskly, rising by 120,000 in May following large gains in the previous 2 months. There was little or no change in the rest of the service-producing sector.

Table A. Mejor indicator: of labor market activity, seasonally ad justed

## Hours of Work

The average workweek of production or nonsupervisory workers on private nonfarm payrolls was up two-tenths of an hour in May to 35.1 hours, seasonally adjusted. The manufacturing workweek, however, edged down a tenth of an hour to 40.0 hours, and factory overtime was do
two-tenths to 2.7 hours; both had risen markedly in the prior 2 months. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private ncreased 0.6 percent to 87.9 and was 5.8 percent above its (1977 December 1982 The manufacturing index Hourly and Weekly Earnings

Average hourly earnings increased by 0.5 percent in May to $\$ 7.99$, seasonally ad justed, while average weekly earnings rose by 1.1 percent. Before adjustment for seasonality, average hourly earnings increased $\$ 4.13$ in May to $\$ 279.30$ and were up $\$ 13.43$ over the year. (See table B-3.)

The Hourly Earnings Index
The Hourly Earnings Index (HEI) was 154.7 (1977-100) in May, seasonally adjusted, 0.5 percent higher than in April. For the 12 months ended in May, the increase (before seasonal ad justment) was 4.9 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in overtine in manufacturing and interindustry during the 12-month period ended in April. (See table B-4.)

## Revisions in the Establishment Survey Data

In accordance with usual practice, the eatablishment survey data published in this release have been revised to reflect new employnent benchaarks based on comprehensive counts derived from uneaployment insurance tax records for March 1982. In addition, new seasonal ad justment
factors have been calculated, and all seasonally ad justed series have been revised to také factors have been calculated, and all se
account of the experience through Marct: 1983.

Sumary eaployment revisions are shown in the following two tables. Table B presents employment estimates, not seasonally adjusted, for February 1983 (the last published final seasonally adjusted over-the-month changes in total nonfarm payroll eaployment estiantes for the January 1982-February 1983 period. Some of the hours and carninga data have changed slightly as a result of the new employaent weights.

For a detalled exanination of the effect of the benchark revisions, see "BLS Eatablishment Estimates Revised to March 1982 Bencharks,", which wll appear in the June isaue of Eaployent and Earninge. New biassonal ad justament factors for use in the codeing year
the seasonal ad justment nethodology will aigo be included fin this article.

Historical eatablishment series (not seagonally adjusted) have been revised from April 1981 forward to reflect the new bencharks; seanonally adjusted series are subject to revision back to January 1978. All revised hiscorical series will be published in a special suppleaent to Enployment and Earnings, which is expected to be iesued in late June. This suppleaent, then 1312-11, will comprise the full historical seriez on national date from the eatablisheent $1312-11$,
survey.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payroils that appears in the 8 tables, marked
ESTABLISHMENT DATA. This information is collected ESTABLLSHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 189,000 establishments employing about 36 million people.
collected for and relate to a particular week. In the housethold collected for and relate to a particular week. In the household
survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical ractors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below

Coverage, defluitions and differences between surveys
The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked is hours or more in an enterprise operated by a member of their family, whether they were paid or no. People are also counted as employed if they were on inpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.
eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for werk because they were laid off and waiting to be recalled and those expecting to report to a job within 30 days.
The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percenlage of unemployed people in the labor force (civilian plus the resioent Armed Forces). Table A-S presents a special
grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$, and the most comprehensive yiedd $\mathrm{U}-7$.
The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, whik U - 5 b represents The overal unemployment rate is U -Sa, whice U -sbe
the same measure with a civilian labor force base.
Unlike the household survey, the establishment counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
----The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
--.-.The household survey includes people on unpaid leave among the employed; the establishment survey does not; and older; the establishment survey is not limited by age; and older; the establishment survey is not limited by age;
because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.
Other differences between the two surveys are described in Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Sansonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young peopie enter the job market. The effect of such seasonal veition can be very account for as much as 95 percent of the month-to-month changes in unemployment.
Because these
Because these seasonal ivents follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from mmath to month. These adjustments make nonseasonal development, such as ef women in the labor force, easier to spor. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to deermine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economiç activity.
contain components such as age and sex. Statistics for all
employees, production workers, average weekly hours, and average hourly earnings include components based on th employer's industry. All these statistics can be seasonally ad justed either by adjusting the total or by adjusting each of the
components and combining them. The second procedure usually yields more accurate information and is therefor followed by BLS. For example, the seasonally adjusted figur for the labor force is the sum of eight seasonally adjuste civilian employment components, plus the resident Arme Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemplo ment is the sum of the four unemployment components, and the overall unemployment rate is derived by dividing th resulting estimate of total unemployment by the estimate of the labor force.
The numerical factors used to make the seasonal ad justments are recalculated regularly. For the household survey, the factors are calculated for the January-June period is applied to data that have been published over the previous years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year alon with the introduction of new benchmarks which are discussed at the end of the next section

## Sampling variability

Statistics based on the houschold and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that woul be obtained from a complete census, even if the same question nares and procedures were used. In he houschid survey, dard errors. The numerical value of a standard error depend upon the size of the sample, the resuits of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that a estimate based on the sample will differ by no more than 1.6 umes the standard error from the results of a complete census. At the 90 -percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in otal employment is on the order of plus or minus 335,000 ; fo atal unemployn it is 0.21 pece, and, for the overs do not mean that the sample results are off by these
magnitudes but, rather, that the chances are 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates bv more than these amounts.
Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the estimate of the size of the tabor force is subject to less error than is the extimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for exampie, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .29 percentage point; for teenagers, it is 1.28 percentage points.
In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are in final form in December To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-10-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## dditional statistics and other information

In order to provide a broad view of the Nation's employin this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 6.00$ per issue or $\$ 39.00$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the cabinser sey and the actual vided in tables M, O, P, and $Q$ of that publication.

' Data relate to production workers in mining and manulacturing; to construction workers in construction; and to nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fiths of the total employees on private nonagricultural payrolis.

This series is not published seasonally adjusted since the seasonal component is small rolative to the trend-cycle and/or irreguler components and consequently cannot be separated with sufficient precision.
$p=$ prellminary.
NOTE: See note on table B-1.

: Number of employees, seasonally adjusted for 1,3 , and 6 month spans, on payroils of 186 private nonagricultural industries.
$p=$ prellminary.

NOTE: Figures are the percent of industries with employment rising. (Half of the un changed components are counted as rising.) Data are centered within the spans.

NOTE: See note on table B-1.

## BLS News Releases Available Electronically

The Bureau of Labor Statistics has inaugurated an electronic news release service that permits persons interested in the Bureau's national economic indicators to gain access directly from the computer in which they are stored.
Cost of the electronic news releases, which can be transmitted over telephone lines to computer terminals and other remote access devices anywhere in the world, ranges from $\$ 8$ to $\$ 15$ per release, plus the cost of the telephone call.
National BLS releases available on-line, immediately upon official release of the data to the public, include:

Employment Situation
Commissioner's statement
before the Joint Economic
Committee
Producer Price Indexes
State and Metropolitan
Area Employment
and Unemployment

## Consumer Price Index

## eal Earning

Productivity and Costs
Employment Cost Index
BLS will continue to make its releases available to the press in the conventional manner. But, news organizations and others now have the option of accessing the releases electronically.
Bic also makes its data avail ble in periodicals published by the Bureau and sold by the Government Printing Office; on computer tape, sold by bls; and in some instances, via Mailgram and in microform.

Information about electronic news releases and about BLS data in other forms is available from the Office of Publications, Bureau of Labor Statistics, Washington, D.C 20212.

## BLS Data Summary by Phone

## A recorded summary of is available 24 hours a day on principal CPI, PPI, and Em- (202) 523-9658.

ployment Situation numbers

[^0]:    N.A. = not available.

[^1]:    ' Persons with no previous work experience are included in the unemployed total.

[^2]:    appeer in the unadusted and the seasonslly adjusted columns.
