USDL 83-340<br>RRANSMISSION OF MATERIAL IN THIS RELEASE IS<br>EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, AUGUST 5, 1983

## THE EMPLOYMENT SITUATION: JULY 1983

Unemployment declined sharply in July and employment surged upward, the Bureau of Labor Statistics of the U.S. Department of Labor announced today. The overall unemployment rate, 9.3 percent, and the rate for civilian workers, 9.5 percent, each fell by half a percentage point over the month and were nearly one-and-a-half points below last December's highs.

Total employment-as measured by the monthly survey of households--rose by 500,000 in July, following an even larger increase in June. The number of employees on nonagricultural payrolls-as measured by the monthly survey of establishments-also rose by about half a million over the month. Increases in payroll employment have totaled 1.7 milifion since last December.

## Unemployment

Both the number of unemployed persons, 10.6 million, and the civilian worker unemployment rate, 9.5 percent, dropped substantially in July. Since last December's high, the jobless total has declined by 1.4 miliion, and the unemployment rate has dropped by 1.3 percentage points. The number of job losers (persons on layoff and those permanently separated from their jobs) fell by 320,000 in July and has declined by 1.1 million since December. (See tables A-2 and A-8.)

The July decrease in unemployment occurred largely among adult women, whose jobless rate declined 0.7 percentage point to 7.9 percent. The rate for adult men, which had decreased markedly in June, edged down further in July to 8.8 percent. There was little change, however, in the unemployment rate for teenagers, whose rate has hovered around 23 percent for more than a year. Whites, blacks, and Hispanics all shared in the overall decline in unemployment. The rate for black workers dropped from 20.6 to 19.5 percent. (See tables A-2 and A-3.)

At 10.5 percent, the jobless rate for workers in manufacturing fell by a full percentage point over the month and has declined by 4.3 points since last December. During the past 7 months, jobless rates have decreased for all major ndustry groups, though most of the improvement has occurred among workers in the goods-pro cing industries. (See table A-6.)

The number of persons unemployed for more than 6 monchs decreased by 365,000 in July; this was the first real decline in this very long-term jobless category in 2 years. The median duration of unemployment declined nearly 2 weeks to 9.9 weeks in July, while the mean duration was about unchanged at 21.7 weeks. (See table A-7.)

## Civilian Employment and the Labor Force

Civilian employment continued to increase substantially, rising by 500,000 in July to 101.3 million (seasonally adjusted). Adult women accounted for 375,000 of the over-the-month increase and adult men nearly 300,000, as teenage employment fell off somewhat following a very large gain in June. Total civilian employment has risen by 2.1 miliion since last December.

At 111.9 million, the civilian labor force was unchanged from June, seasonally adjusted, after a huge advance--1.2 million--in the prior month. Since last July, the labor force has grown by 1.5 million. (See table A-2.)

## Industry Payroll Enployment

Nonagricultural payroll employment rose by nearly half a million in July, the largest monthly gain in 1983 and the fourth consecutive strong increase. At 90.3 million, the July job
total was the highest since February 1982. Since December, payroll jobs have increased by 1.7 million. (See table B-1.)

July employment gains were widespread, with increases occurring in 70 percent of the 186 industries which make up the BLS index of diffusion. (See table B-6.) Manufacturing posted sharp job growth for the fourth straight month, with durable goods industries accounting for the bulk of the over-the-month increase of 160,000 . Transportation equipment, machinery, and electric and electronic equipment were the biggest gainers in durable goods, with lumber and wood products, furniture and fixtures, and primary and fabricated metals also showing strength. Among the nondurable goods industries, the most notable increases occurred in apparel and rubber and plastic products.

Elsewhere in the goods-producing sector, employment rose in mining for the second month in a row, primarily due to job gains in oil and gas extraction. Strong performance continued in construction, where the July increase was 40,000 and job growth since March has totaled 230,000.

| Manufacturing overtime............... | 2.3 | 2., | 2.8p | 2.7 | 2.9p | 3.1p | 0.2p |

The service-producing sector registered an over-the-month increase of 270,000 jobs, with gains occurring almost entirely in services (140,000) and State and local government (120,000). Service industry employment has grown by more than 500,000 in the last 5 months.

Hours of Work
At 35.1 hours in July, the average workweek of production or nonsupervisory workers on private nonfarm payrolls was unchanged from May and June levels. Manufacturing hours edged up 0.1 hour to 40.3 , an hour and a half above its September 1982 cyclical low. Factory overtime rose 0.2 hour and at 3.1 hours was at its highest level since December 1980. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls-a comprehensive measure which reflects changes in employment as well as hours--rose by 0.6 percent in July to 106.3 (1977=100). The manufacturing index was 90.4 , up 1.7 percent in July and almost 9 percent since December's low. (See table B-5.)

## Hourly and Weekly Earnings

Average hourly and weekly earnings both rose by one quarter of one percent in July, seasonally adjusted. Before adjustment for seasonality, average hourly earnings, at $\$ 7.99$, were up 2 cents over the month and 31 cents over the year. Weekly earnings, at $\$ 282.85$, increased $\$ 1.51$ from June and $\$ 12.51$ from July 1982. (See table B-3.)

## The Hourly Earnings Index

The Hourly Earnings Index (HEI) was 155.2 (1977 $=100$ ) in July, seasonally adjusted, 0.2 percent higher than in June. For the 12 months ended in July, the increase (before seasonal adjustment) was 4.3 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI increased 2.1 percent during the 12 -month period ended in June. (See table B-4.)

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about $\mathbf{6 0 , 0 0 0}$ households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the $B$ tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes approximately 189,000 establishments employing about 36 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal asjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Memberof the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off and waiting to be recalled and those expecting to report to a job within 30 days.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor foroe (civilian plus the resident Armed Forces). Table A-5 presents a special
grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields U-1, and the most comprehensive yields U-7. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 \mathrm{~b}$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
----The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
-----The household survey includes people on unpaid leave among the employed; the establishment survey does not;
-----The houschold survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
-----The household survey has no duptication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over a course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all
employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At the 90 -percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minus 335,000 ; for total unemployment it is 240,000 ; and, for the overall unemployment rate, it is 0.21 percentage point. These figures do not mean that the sample results are off by these
magnitudes but, rather, that the chances are $\mathbf{9 0}$ out of 100 that the 'true"' level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .29 percentage point; for teenagers, it is 1.28 percentage points.

In the establishment survey, estimates for the $\mathbf{2}$ most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by bls. It is available for $\mathbf{\$ 6 . 0 0}$ per issue or $\mathbf{\$ 3 9 . 0 0}$ per year from the U.S. Government Printing Office, Washington, D.C. 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

## BLS News Releases Available Electronically

The Bureau of Labor Statistics has inaugurated an electronic news release service that permits persons interested in the Bureau's national economic indicators to gain access directly from the computer in which they are stored.

Cost of the electronic news releases, which can be transmitted over telephone lines to computer terminals and other remote access devices anywhere in the world, ranges from $\$ 8$ to $\$ 15$ per release, plus the cost of the telephone call.

National BLS releases available on-line, immediately upon official release of the data to the public, include:

Commissioner's statement before the Joint Economic Committee
Consumer Price Index
Earnings of Workers and Their Families
Employment Cost Index
Employment Situation
Major Collective Bargaining
Settlements

Occupational Injuries and Illnesses
Producer Price Indexes Productivity and Costs Real Earnings
State and Metropolitan Area Employment and Unemployment
U.S. Import and Export Price Indexes

Bls will continue to make its releases available to the press in the conventional manner. But, news organizations and others now have the option of accessing the releases electronically.

BlS also make its data available in periodicals published by the Bureau and sold by the Government Printing Office; on computer tape, sold hv bls; and, in some instances, via Mailgram and in microform.

Information about electronic news releases and about BLS data in other forms is available from the Office of Publications, Bureau of Labor Statistics, Washington, D.C. 20212.

[^0]:    - Unemployment as a percent of the civillan labor force.

[^1]:    NOTE: Occupatlonal detail may not add to totals because of changes in the estima

[^2]:    The population figuree are not acjuated for sameonal variation; therefore, identional numbere appear in the unedfueted and the eeaconally edjusted columnt.

[^3]:    See footnote 1, table B-2.
    Percent change was 2.1 percent from June 1982 to June 1983, the lateat month avallable.
    Percent change was 0.0 percent froa May 1983 to June 1983 , the latest month available.
    These serfes are not seasonaliy adjusted since the seasonal component is saill relative to the trend-cycle andor irregular components and consequently cannot be aeparated with aufficient precision.
    N.A. = not avallable.
    $p$ * prelininary.
