TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, JUNE 7, 1985

Nonfarm payroll employment continued to increase in May, and unemployment was the same for the fourth month in a row, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The overall jobless rate of 7.2 percent and the civilian worker rate of 7.3 percent have changed very little since last fall.

The number of persons on nonagricultural payrolls-as measured by the monthly survey of establishments--rose by 345,000 in May, after seasonal adjustment, to 97.5 million. (Establishment survey data have been revised to reflect annual benchmarks and updated seasonal adjustment factors; see note on page 4.) Civilian employment--as measured by the household survey--was unchanged over the month at 107.0 million.

## Unemployment (Household Survey Data)

Both the seasonally adjusted level of unemployment ( 8.4 million) and the jobless rate for civilian workers ( 7.3 percent) were at the levels that have prevailed since February. However, there were significant over-the-month developments for some labor force groups.

Among adult men, for example, there were divergent movements in the jobless rates for prime working age and younger men. For men 25 to 54 years old, the rate fell from 5.8 to 5.2 percent, lower than in any month since just before the $1981-82$ recession. In contrast, the.rate for men 20 to 24 years of age increased by 1.2 percentage points to 12.5 percent. The unemployment rate for teenagers of both sexes also rose-from 17.7 to 18.9 percent, principally due to increased joblessness for those of college age (18-19 years). Some of the increased unemployment of 18-24 year-olds may stem from the fact that the survey week was late in the month (May 12-18), after many colleges had completed their spring terms. Rates for adult women in most age groups were little changed over the month. As has been true since last autumn, the overall unemployment rates for whites ( 6.2 percent), blacks ( 15.6 percent), and persons of Hispanic origin ( 10.7 percent) remained virtually unchanged. (See tables A-2, A-3, and A-9.)

Despite the lack of change in overall unemployment, the number of job losers decreased to 3.9 million, the lowest level since prior to the recession. Offsetting this decline was an increase in the number of entrants to the labor force. The number of persons unemployed for 6 months or more fell to 1.2 million, and both measures of average duration of unemployment dropped, the median to 6.2 weeks and the mean to 14.9 weeks. (See tables A-7 and A-8.)

NOTE: Establishment data have been revised to reflect March 1984 benchmarks and updated seasonal adjustment factors.

The number of workers on part-time schedules for economic reasons--often referred to as the partially unemployed--rose by 250,000 to 5.9 million. This is the highest level in more than a year. (See table A-4.)

Civilian Employment and the Labor Force (Household Survey Data)
As in April, civilian employment rose in line with usual seasonal patterns and, after adjustment, was little changed over the month. The employment-population ratio held at 60.1 percent. (See table A-2.)

The civilian labor force was unchanged over the month at a seasonally adjusted level of 115.4 million. Over the year, the labor force increased by 1.6 million. All of this increase occurred among adult women and men. The teenage labor force has held steady for the past 2 years, as marked increases in their rate of labor force participation have offset a declining population.

## Industry Payroll Employment (Establishment Survey Data)

Total nonagricultural payroll employment rose by 345,000 in May to 97.5 million, after adjustment for seasonality. The May job growth was concentrated in the service-producing sector, which has accounted for seven-eighths of the 3.5 million over-the-year increase in employment. (See table B-1.)

The largest over-the-month employment gains took place in services and retail trade--110,000 each--as these two industries continued to account for the bulk of the job expansion. Elsewhere in the service-producing sector, moderate job growth continued in wholesale trade and finance, insurance, and real estate.

Construction employment increased by 30,000 , after seasonal adjustment, to 4.7 million. Thus far in 1985, more than 200,000 construction jobs have been added. In contrast, manufacturing employment waned over this period; the May employment total, at 19.4 million, was 160,000 lower than in December. Over the month, declines continued in the apparel and textile mill products industries, which since December posted a combined reduction of 55,000 jobs. Employment in electrical and electronic equipment also edged down in May; after showing strong growth in 1983 and 1984, jobs in this industry have dropped by 35,000 in the first 5 months of this year.

## Weekly Hours (Establishment Survey Data)

The average workweek of production or nonsupervisory workers on private nonagricultural payrolls eased a tenth of an hour in May; seasonally adjusted. However, weekly hours in manufacturing increased by 0.2 hour to 40.3 hours, whereas factory overtime dropped by 0.2 hour to 3.1 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls rose 0.3 percent in May to 116.0
$(1977=100)$. The manufacturing index edged up 0.1 percent over the month to 93.4 but was still below the levels which prevailed during 1984. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings increased 0.1 percent in May, while average weekly earnings decreased 0.2 percent, seasonally adjusted. Prior to seasonal ad justment, average hourly earnings rose one cent to $\$ 8.54$, and average weekly earnings increased. by $\$ 1.20$ to $\$ 298.90$. Compared with a year earlier, hourly earnings were up 26 cents, and weekly earnings rose by \$7.44. (See table B-3.)

## The Hourly Earnings Index (Establishment Survey Data)

The Hourly Earnings Index (HEI) was 164.9 (1977=100) in May, seasonally adjusted, an increase of 0.1 percent from April. For the 12 months ended in May, the increase (before seasonal ad justment) was 3.1 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in overtime in manufacturing and interindustry employment shifts. In dollars of constant purchasing power, the HEI decreased 1.2 percent during the 12 -month period ended in April. (See table B-4.)

## Revisions in the Establishment Survey Data

In accordance with the usual practice, the establishment survey data published in this release have been revised to reflect complete counts of employment (benchmarks) derived principally from unemployment insurance tax records for the first quarter of 1984, plus preliminary counts from the same source for the second and third quarters. In addition, new seasonal adjustment factors have been calculated, and all seasonally adjusted series have been revised to take account of the experience through March 1985.

Employment estimates, (not seasonally adjusted) for February 1985 on the old and new benchmarks are presented in Table B. (February 1985 was the last month that published final estimates are available based on the previous benchmark.) As can be seen, the biggest revisions occurred in retail trade (up 394,000 ), services (up 150,000 ), and manufacturing (down 173,000). Data on hours and earnings may have changed slightly as a result of the new employment weights.

The June 1985 issue of Employment and Earnings will contain a detailed discussion of the effects of the benchmark, seasonal adjustment factors for use in the ensuing 12 -month period, and revised data for all regularly published tables containing national establishment survey data on employment, hours, and earnings.

## Explanatory Note

- 5 -

As a result of these changes, establishment series have been revised from April 1983 forward, and seasonally adjusted series have been revised back to January 1980. All of the revised historical series will be published in a special supplement to Employment and Earnings, which is expected to be issued within a month or so. This supplement, when combined with the historical volume, Employment, Hours, and Earnings, United States, 1909-84, Bulletin 1312-12, will comprise the full historical series on national data from the establishment survey.

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in he A tables, marked HOUSEHOLD DATA. It is a sample survey of about 59,500 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the mployment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by bLS in cooperation with State agencies. The sample includes over 200,000 establishments employing over 35 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adfactors, ins, and the insitable variance in results between a justments, and the inevitable variance in results between a of these factors is explained below.

## Coverage, definitions, and differences

## between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. lach person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all People are classified as employed if they did any work at all
as pasd civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of ilnness, bad weather, disputes beween labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total
People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Also included among the unemployed are persons not looking for work because they were laid off and waiting to be recalled and those expecting to report to a job within 30 days.
The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields $\mathrm{U}-7$. The overall unemployment rate is $U-5 a$, while $U-5 b$ represents the same measure with a civilian labor force base.
Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey. allhough based on a smaller sample. reflects a the eelfempored, popal folly workers. privale houschold workers. and . privale household workers. and nember of the resident Armed Forces:
- The household survey includes people on unpald leave among the mployed: the establishment survey does not,
-- The houschold survey is limuted to those 16 years of age and older; the evablushment survey is not limuled by age:
-- The household survey has no duplication of individuals, because each indw dual in counted only once: in the establshment survey, employees workng at more than one job or otherw see appearing on more than one payroll would be ounted separately tor each appearance

Other differences between the two surveys are described in 'Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the bls upon request

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or $i_{\mu}$ creases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BIS. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-Ju:: n period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 328,000 ; for total unemployment it is 220,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .26 percentage point; for teenagers, it is 1.25 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BI $S$ regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BI S. It is available for $\$ 4.50$ per issue or $\$ 31.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

NOTE: Male Vietnam-era veterans are men whe eerved In the Armed Focces between August 5, 1834 and May 7, 1975. Nonveterans are men who have never eerved in the Armed Forces; published date are limited to thoee 30 to 44 yeers of ege, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

Oata for 20 to 2eycer-ovd veterans ere no longer shown in this trbiv because the grow ts rapldty dieappearing (into the 30-34 eqe catceory) and the numbers remaining for some labor force categories are not large enough to werrant their continued publication.
