THE EMPLOYMENT SITUATION: NOVEMBER 1985
The number of nonfarm jobs on business payrolls rose in November, and unemployment was about unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The overall unemployment rate was 6.9 percent, and the civilian worker rate was 7.0 percent. Both rates were about the same as in the prior 3 months and slightly below the levels prevailing earlier in the year.

Nonagricultural payroll employment-as measured by the monthly survey of establishments--edged up 180,000 in November, while civilian employment-as measured by the monthly survey of households--was little changed. Both series registered substantial growth in recent months, with each about 1 million higher in November than in July. Since the business cycle trough in November 1982, the number of nonfarm payroll jobs has grown by over 10 million. The household survey count of civilian employment increased by close to 9 million over the 3-year period.

## Unemployment (Household Survey Data)

The civilian worker unemployment rate ( 7.0 percent) and the unemployment level ( 8.1 million) were both little changed in November. While the teenage unemployment rate fell to near the levels prevailing before October's sharp rise, there were no over-the-month changes in adult joblessness. A slight decline in unemployment among whites in November (to 5.9 percent) contrasted with a small rise in unemployment among black workers (to 15.9 percent). The unemployment rate among workers of Hispanic origin ( 10.7 percent) was about the same as in recent months. (See tables $\mathrm{A}-2$ and $\mathrm{A}-3$.

Half of the unemployed reported that they had lost their last jobs, about in line with the proportions prevailing over the past year. Labor force entrants accounted for 40 percent of the total and job leavers for the remaining 10 percent. The median duration of unemployment was essentially unchanged at 7.0 weeks, but mean duration rose to 16.0 weeks. (See tables A-7 and A-8.)

The Civilian Labor Force and Employment (Household Survey Data)
Following a large increase in October, the civilian labor force held about steady in November. Moreover, there were no significant changes in the number of men, women, or teenagers in the work force. Over the year,

the labor force grew by about 2.0 million, or 1.7 percent, to 116.1 million. Adult women accounted for nearly 70 percent of this increase. (See table A-2.)

At 107.9 million, civilian employment was unchanged in October, and there were no significant changes among the major age, sex, race, or ethnic groupings. The employment-population ratio remained at the record high of 60.3 percent. In the past year, civilian employment rose by about 2.0 million, or 1.9 percent.

The number of persons working short weeks (less than 35 hours), which accounts for nearly a fifth of the total at work, has risen over the year. The number voluntarily at work part time increased by just over half a million to 13.7 million, whereas the number working part time for economic reasons, at 5.5 million, was not much different from a year earlier. (See table A-4.)

Industry Payroll Employment (Establishment Survey Data)
The number of employees on nonagricultural payrolls edged up in November to 98.8 million, seasonally adjusted. The increase of 180,000 followed larger gains in recent months. Although over-the-month increases were generally small, they were fairly widespread, as the BLS index of diffusion remained at about 60 percent. (See tables $B-1$ and $B-6$.

Within the service sector, there were substantial over-the-month advances in the services division (including continued gains in both business and health services) and in finance, insurance, and real estate, with more modest gains in wholesale trade and transportation and public utilities. In contrast, the number of jobs in retail trade was about unchanged after seasonal adjustment, although seasonal hirings in general merchandise stores were below the expected holiday increase.

Employment in the goods-producing sector was basically unchanged in November, following a substantial increase in October. After seasonal adjustment, the level of manufacturing employment in November was not significantly different than in October but was up by nearly 100,000 from September, halting the trend of job losses which had occurred earlier in the year. Construction employment, which has advanced by 335,000 over the year, was about unchanged in November.

Weekly Hours (Establishment Survey Data)
Average weekly hours of production or nonsupervisory workers on private nonagricultural payrolls edged down in November to 35.0 hours. The manufacturing workweek remained at 40.7 hours, sustaining the very high level which has been in evidence since August. Factory overtime rose slightly to 3.4 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls, at 117.3 (1977=100) seasonally
adjusted, was little changed from October, as the modest gain in employment just about offset the somewhat shorter workweek. The manufacturing index also was about unchanged over the month but was up 1.1 percent from July. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings increased by 0.3 percent, while average weekly earnings were little changed in November, after adjustment for seasonality. On an unadjusted basis, hourly earnings rose 2 cents to $\$ 8.67$, while weekly earnings fell $\$ 1.04$ to $\$ 302.58$. Over the past year, hourly earnings rose 24 cents, and weekly earnings advanced $\$ 6.69$. (See table B-3.)

The Hourly Earnings Index (Establishment Survey Data)
The Hourly Earnings Index (HEI) was 166.9 ( $1977=100$ ) in November, seasonally adjusted, an increase of 0.3 percent from October. For the 12 months ended in November, the increase was 2.9 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in manufacturing overtime and interindustry employment shifts. In dollars of constant purchasing power, the HEI increased 0.1 percent during the 12 month period ended in October. (See table B-4.)

## Improved Population Estimates for the Household Survey

Effective with data for January 1986, two technical changes will be introduced in the population estimates used as controls for the household survey. One will reflect an explicit allowance for undocumented immigrants since 1980 (largely Hispanic). This change will be offset somewhat by an improved estimate of emigration from the United States, also since 1980 . The net effect of these adjustments will be to increase the working age population by roughly 300,000 . For the population as a whole, this should have little effect on the data. The adjustment for the Hispanic-origin population will be much larger, however, and BLS plans to revise the data to the extent possible back to 1980 .

The Employment Situation for December 1985 will be released on Wednesday, January 8, 1986, at 8:30 A.M. (EST). Release dates for the balance of 1986 are as follows:

| Feb. 7 | Aug. | 1 |

| May 2 | Nov. | 7 |
| June 6 | Dec. | 5 |
| July 3 |  |  |

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 59,500 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by bls in cooperation with State agencies. The sample includes over 200,000 establishments employing over 35 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields $\mathrm{U}-7$. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 \mathrm{~b}$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;
- The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the bls upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bls. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. At the time the first half year's factors are calculated (upon availability of data for December), historical data for the previous 5 -year period are subject to revision. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling varlability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bls in its analyses-the error for the monthly change in total employment is on the order of plus or minus 328,000 ; for total unemployment it is 220,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .26 percentage point; for teenagers, it is 1.25 percentage points.
In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by bls. It is available for $\$ 4.50$ per issue or $\$ 31.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

' The population and Armed Forces figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.

2 Includes members of the Armed Forces stationed in the Unlted States.
; Labor force ss a percent of the noninstitutional population.

- Total employment as a percent of the noninstitutional population
- Unemployment as a percent of the labor force (including the resident Armed Forces).

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5. 1964 and May 7, 1975. Nonveterans are men who have nover served in the Armed Forces; published data are limited to those 30 to 44 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

Data for 25- to 29 -year-old veterans are no longer shown in this table because the group s rapidiy disappearing (into the $30-34$ age category) and the numbers remaining for some labor force categories are not large enough to warrant their continued publication.

Table A.13. Employment status of the civilian population for eleven large States
(Numbers in thousands)

[^0]:    - The population figures are not adjusted for seasonal valation; therofore, identical numbers appear in the unadjusted and seasonally adjusted columns.
    : Clvilian employment as a percent of the civilian noninstitutional population.

[^1]:    See footnotel, table B-2.
    Percent change is . 1 percent from October 1984 to October 1985 , the 1atest month available.
    Percent change is -. 5 percent from September 1985 to October 1985 , the latest month avallable
    These series are not seasonally adjusted since the seasonal component is small relative to the trend-cycle andor irregular components and consequently cannot be separated with sufficient precision.
    N.A. = not avallable.
    $p=p r e l i m i n a r y$.
