TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EST), FRIDAY, MARCH 7, 1986

## THE EMPLOYMENT SITUATION: FEBRUARY 1986

Unemployment rose in February, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The overall unemployment rate, 7.2 percent, and the rate for civilian workers, 7.3 percent, each increased six-tenths of a percentage point from January, returning to the levels that prevailed during the first half of last year.

The two surveys produced contrasting employment developments in February. The number of nonagricultural payroll jobs--as measured by the monthly survey of business establishments-rose by 225,000 , seasonally adjusted, despite declines in the goods-producing industries. Total civilian employment-as measured by the monthly survey of households--declined by 400,000, following an increase of the same magnitude in January (after allowance is made for population adjustments introduced into the survey in January). Half of the decline was among agricultural workers, who are not covered by the payroll survey.

Unemployment (Household Survey Data)
Civilian unemployment rose by 700,000 to 8.5 million in February. This unusual increase was concentrated in certain groups in the economy. Two-thirds occurred in just three states--California, Texas, and Illinois; one-quarter was among Hispanics; and almost three-quarters was among workers aged 25 and over. (See tables A-2, A-3, and A-13.)

The civilian unemployment rate rose 0.6 percentage point in February to 7.3 percent, seasonally adjusted. The jobless rate had been improving slowly since last summer, and February's rise returns it to the level that prevailed throughout the first half of 1985. Most major labor force groups showed increases in their jobless rates. Rates for adult men ( 6.2 percent) and women ( 6.7 percent) and full-time workers ( 6.9 percent) were all about half a point higher than in the previous month. Joblessness for part-time workers rose a full point to 9.4 percent. The teenage unemployment rate, at 19.0 percent, was not significantly different from a month earlier. While the rates for whites ( 6.4 percent) and Hispanics ( 12.3 percent) were
up sharply, that for blacks (i4.8 percent) was at the same general level of recent months. (See tables $A-2, A-3$, and $A-6$.)

The rise in unemployment was evident in all duration categories, such that the median and mean were about unchanged in February, at 6.9 and 15.3 weeks, respectively. Unemployment increases were concentrated among those

who lost their jobs and do not expect recall ("other job losers") and among labor force entrants, particularly reentrants. The number of job leavers and those on layoff were unchanged. (See tables A-7 and A-8.)

Civilian Employment and the Labor Force (Household Survey Data)
Civilian employment fell almost 400,000 to 108.6 million in February, offsetting gains made in the previous month. Half of the February employment reduction came in agriculture. Adult men and women had reductions in employment of 320,000 and 270,000 , respectively, while employment among teens rose 200,000. The employment-population ratio-the proportion of the civilian population with jobs--declined 0.2 percentage point to 60.4 percent, matching December's figure. Except for January's 60.6 percent, these proportions are the highest ever recorded.

The civilian labor force grew by 300,000 to 117.1 million in February. This was about 1.8 million higher than a year earlier (after correcting for revisions in the underlying population estimates that were introduced in January). Adult women accounted for over 1 million of this increase, and adult men added about 850,000 , while teenagers were about unchanged.

## Industry Payroll Employment (Establishment Survey Data)

The number of employees on nonagricultural payrolls increased by 225,000 in February to 99.7 million, after seasonal adjustment. The overall change was marked by a continuation of strength within the service-producing sector that was partially offset by declines in the goods-producing industries. The weakness in the goods sector was reflected in the fact that only about half of the industries in the BLS index of diffusion posted gains, in contrast to more widespread increases in the previous 4 months. (See tables $B-1$ and $B-6$.

In the service-producing sector, the largest over-the-month gains took place in services and retail trade--nearly 120,000 in each, after seasonal adjustment. Taken together, their employment increased by 1.9 million over the year, accounting for nearly two-thirds of the jobs added to payrolls over this period. Sizable over-the-month employment increases also took place in finance, insurance, and real estate and wholesale trade. Altogether, employment rose by 295,000 in the service-producing sector.

Within the goods-producing sector, mining jobs fell by 15,000 . All of this decline occurred in oil and gas extraction, which has been drifting downward since mid-1985. Construction employment dropped by 25,000 in February, after seasonal adjustment. This decline may have resulted from harsh weather conditions in February that followed much milder conditions in the prior month.

Manufacturing employment edged down by 30,000 over the month, after having exhibited small employment gains in each of the prior 4 months. This represented a return to the December employment total of 19.4 million.

The largest over-the-month decline occurred in the apparel industry, which fell by 15,000. E1sewhere in manufacturing, small declines occurred in fabricated metals, machinery, and motor vehicles and equipment.

Weekly Hours (Establishment Survey Data)
Average weekly hours for production or nonsupervisory workers on private nonagricultural payrolls declined 0.2 hour to 35.0 hours, seasonally adjusted, in February. The manufacturing workweek decreased by 0.3 hour to 40.6 hours, down from the very high levels of the previous 2 months but otherwise in line with the relatively high levels that prevailed in the August-November period. Factory overtime also declined, by 0.1 hour to 3.4 hours. Weekly hours in construction fell markedly over the month, in large part the result of unusually bad weather that plagued much of the country during the survey reference week. (See table B-2.)

Due to the drop in hours, the index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls--which reflects developments in both hours and employment--dropped 0.3 percent to $118.9(1977=100)$ in February. Indexes decilned sharply over the month in construction, mining, and manufacturing. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings rose 0.5 percent in February, and weekly earnings were little changed, after adjustment for seasonality. Prior to seasonal adjustment, average hourly earnings were unchanged over the month at $\$ 8.74$, and average weekly earnings were down $\$ 1.75$ to $\$ 302.40$. Over the past year, hourly earnings were up 22 cents, and weekly earnings rose \$7.61. (See table B-3.)

## The Hourly Earnings Index (Establishment Survey Data)

The Hourly Earnings Index (HEI) was 168.5 ( $1977=100$ ) in February, seasonally adjusted, an increase of 0.6 percent from January. For the 12 months ended in February, the increase was 2.8 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in manufacturing overtime and interindustry employment shifts. In dollars of constant purchasing power, the HEI decreased 1.0 percent during the 12 -month period ended in January. (See table B-4.)

The Employment Situation for March 1986 will be released on Friday, April 4, at 8:30 A.M. (EST).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 59,500 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 200,000 establishments employing over 35 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.
People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They bad no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields U-1 and the most comprehensive yields U-7. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 \mathrm{~b}$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;
-     - The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bls. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.
The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. At the time the first half year's factors are calculated (upon availability of data for December), historical data for the previous 5 -year period are subject to revision. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bls in its analyses-the error for the monthly change in total employment is on the order of plus or minus 328,000 ; for total unemployment it is 220,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.
Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .26 percentage point; for teenagers, it is 1.25 percentage points.
In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, bLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLs. It is available for $\$ 4.50$ per issue or $\$ 31.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $M, \mathbf{O}, \mathrm{P}$, and Q of that publication.

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5. 1864 and May 7, 1975. Nonveterans are men who have never served in the Armed Forces; published data are limited to those 30 to 44 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

Data for 25- to 20-year-old veterans are no longer shown in this table because the group is rapidly disappearing (into the $30-34$ age category) and the numbers remaining for some labor force categories are not large enough to warrant their continued publication.
