TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, JUNE 5, 1987

THE EMPLOYMENT SITUATION: MAY 1987
Employment rose in May and the unemployment rate was unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Following a marked decline in April, the overall unemployment rate remained at 6.2 percent and the civilian worker rate at 6.3 percent. Both were nearly a percentage point lower than a year earlier.

Total civilian employment--as estimated through the monthly survey of households--showed an increase of about 600,000, seasonally adjusted, whereas nonagricultural payroll employment-as measured by the monthly survey of establishments--rose by 125,000 .

Unemployment (Household Survey Data)
The civilian unemployment rate was unchanged at 6.3 percent in May, and the number of persons unemployed remained at 7.5 million, about 800,000 less than a year earlier. The unemployment rates for adult men (5.5 percent) and women ( 5.4 percent), while unchanged over the month, have dropped substantially during the last year. The unemployment rates for teenagers ( 17.7 percent), whites ( 5.3 percent), and Hispanics ( 8.7 percent) were little changed, although the Hispanic rate has fallen 2 percentage points so far this year. The jobless rate for blacks ( 13.8 percent) returned to its March level after falling in April. (See tables A-2 and A-3.)

Among the unemployed, there was a small increase in May in the number seeking their first jobs. In terms of duration, there was also a small increase in the number of persons unemployed for less than 5 weeks. The median duration of unemployment declined to 6.5 weeks. (See tables A-7 and A-8.)

Civilian Employment and the Labor Force (Household Survey Data)
Civilian employment rose to 112.4 million, a seasonally adjusted gain of about 600,000 . Most of the increase was among adults, particularly women. The employment-population ratio--the proportion of the working age population who held jobs--increased by three-tenths of a percentage point. (See table A-2.)

The civilian labor force also showed a sharp increase (660,000), following 2 months of little change. The labor force participation rate was up three-tenths of a percentage point to 65.7 percent.

benchmarks and updated seasonal adjustment factors.
p=preliminary.

Industry Payroll Employment (Establishment Survey Data)
The data from the establishment survey showed a relatively small job gain for May, bringing nonagricultural payroll employment to a level of 101.7 million, after seasonal adjustment. This level reflects the results of the annual benchmark adjustment of these data, which has produced a downward revision. (See the explanatory note on pages 4-5 for a description of the benchmark process.)

Gains in May were essentially limited to the services industry and in finance, insurance, and real estate. Continuing the strong growth in evidence during the current expansion, employment in the services industry rose by 95,000 in May. About half of the increase was in business and health services. Finance, insurance, and real estate also continued to expand with an over-the-month employment gain of 15,000. Employment in both wholesale and retail trade was unchanged after seasonal adjustment. (See table B-1.)

In the goods-producing sector, construction employment rose a little less than expected for this time of the year and, after seasonal adjustment, was down slightly from the April level. Mining and its oil and gas extraction component have shown small increases over the last few months. Manufacturing employment remained unchanged in May, as movements among individual industries were small and generally offsetting.

Weekly Hours (Establishment Survey Data)
The average workweek of production or nonsupervisory workers on private nonagricultural payrolls edged up 0.1 hour to 34.8 hours, seasonally adjusted, returning to the March level. In manufacturing, the workweek rose by 0.4 hour to 41.0 , rebounding from the previous month's dip, which had stemmed from religious observances in the reference week. Factory overtime rose by 0.3 hour to 3.8 , the highest level since April 1978. (See table B-2.)

Largely as a result of the increase in hours of work, the index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls rose by 0.4 percent to $120.1 \quad(1977=100)$, seasonally adjusted. This was 2.5 percent higher than the May 1986 index. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings rose by 0.4 percent in May, while average weekly earnings rose 0.7 percent, seasonally adjusted. Prior to seasonal adjustment, hourly earnings increased by 2 cents to $\$ 8.92$, and weekly earnings were up $\$ 2.48$ to $\$ 310.42$. (See table B-3.)

The Hourly Earnings Index (Establishment Survey Data)
The Hourly Earnings Index (HEI) was 172.6 ( $1977=100$ ) in May, seasonally adjusted, essentially unchanged from April. For the 12 months ended in May, the increase was 2.2 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements-fluctuations in manufacturing overtime and interindustry
employment shifts. In dollars of constant purchasing power, the HEI decreased 1.3 percent during the 12 -month period ended in April. (See table B-4.)

## Revisjons in the Establishment Survey Data

In accordance with annual practice, the establishment survey data published in this release have been revised to reflect complete counts of employment (benchmarks). The counts are principally derived from unemployment insurance tax records for the first quarter of 1986. In addition, new seasonal adjustment factors have been calculated to take account of the experience through March 1987.

The effects of these adjustments on current data are shown in table $B$, which presents data prior to seasonal adjustment for February 1987, the last month of final published estimates prior to this benchmark revision.

To reflect these changes, establishment data series have been revised from April 1985 forward, and seasonally adjusted series have been revised back to January 1982. The June 1987 issue of Employment and Earnings will contain a discussion of the effects of the benchmark, seasonal adjustment factors for use in the ensuing 12 -month period, and revised data for all regularly published tables containing national establishment survey data on employment, hours, and earnings. All of the revised historical series will be published in a special supplement to Employment and Earnings, which is expected to be issued in about a month. This supplement, when combined with the historical volume, Employment, Hours, and Earnings, United States, 1909-84, Bulletin 1312-12, will comprise the full historical series on national data from the establishment survey.

The Employment Situation for June 1987 will be released on Thursday, July 2, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 59,500 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tabies, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 290,000 establishments employing over 38 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report tc a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields U-1 and the most comprehensive yields U-7. The overall unemployment rate is $U-5 a$, while $U-5 b$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:
> - The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
> - The household survey includes people on unpaid leave among the employed; the establishment survey does not;

- The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the bls upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less reguiar pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or dectined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bls. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by BLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 328,000 ; for total unemployment it is 220,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .26 percentage point; for teenagers, it is 1.25 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 8.50$ per issue or $\$ 22.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

[^1] Armed Forces are included in the unemployed total.

Table A-12. Employment status of male Vietnam-era voterans and nonveterans by age, not seasonally adjusted

| (Numbers in thousands) |
| :--- | :--- |

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Arm-
ed Forces; published data are limited to those 30 to 44 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.
