TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, AUGUST 7, 1987

Enployment rose substantially in July, while unemployment was little changed, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The overall unemployment rate was 5.9 percent, and the rate for civilian workers was 6.0 percent. Both were a full percentage point lower than a year earlier, with the improvement particularly strong since February.

Total civilian employment--as measured by the monthy survey of households--rose by 470,000 in July. The number of nonagricultural payroll jobs--as neasured by the nonthly survey of establishments--was up by 300,000. Over the past year, the two employment series have advanced by 2.8 and 2.5 million, respectively.

Unemployment (Household Survey Data)
Both the number of unemployed persons, 7.2 million in July, and the civilian unemployment rate, 6.0 percent, were little changed from June, after seasonal adjustment. Similarly, jobless rates for adult men and women (both at 5.4 percent), teenagers ( 15.5 percent), whites (5.1 percent), blacks (12.6 percent), and Hispanics (7.9 percent) all showed little change between June and July. Over the past year, however, unemploynent rates dropped considerably for all these worker groups. (See tables A-2 and A-3.)

The number of persons jobless for 15 weeks or more fell by about 150,000 in July to 1.9 million, the lowest level since June 1980. The average (mean) duration of unemployment fell from 14.8 weeks in June to 14.0 weeks in July. (See table A-7.)

Civilian Employment and the Labor Force (Household Survey Data)
Civilian employment rose by 470,000 in July to 112.7 million an a seasonally adjusted basis. Over the year, employment increased by 2.8 milion, with adult women accounting for 1.4 million of the gain, adult men for 1.2 million, and teenagers for 200,000 . (See table A-2.)

The civilian labor force increased by about 435,000 in Jiy, aster seasonal adjustment, following a drop of similar nagnitude in the previous
month. Prior to seasonal adjustment, very large labor force increases typically occur in the April-to-July period, as young people leave school and enter the summer job market. This often results in uneven

month-to-month changes in the 1 abor force, even after seasonal adjustment. During this year's summer expansion period, the labor force was up about 600,000 after seasonal adjustment. (See table A-2.)

Industry Payroll Empl oyment (Establishment Survey Data)
Total nonagricultural employment rose by about 300,000 in July to 102.1 million, after seasonal adjustment. This inc rease followed 2 months of slow job growth in business establishments. While the service-producing sector accounted for most of the over-the-month employment increase, as it usually does, job gains were also widespread in manufacturing industries, after seasonal adjustment. (See table B-1.)

In the goods-producing sector, manufacturing employment rose by 70,000 , to 19.1 million in July. This gain occurred despite an employment decline of 40,000 in motor vehicles and equipment, primarily reflecting model changeover and inventory adjustments. Construction employment was unchanged in July and has experienced little movement, on a seasonally adjusted basis, since January. The number of jobs in mining and its oil and gas extraction component edged up, continuing a recent trend of small empl oyment gains.

In the service-producing sector, the services industry rose by 80,000 in July, paced by a 35,000 gain in its health services component. Employment in retail trade advanced by 60,000 , following 2 months of little change. The finance, insurance, and real estate industry continued to expand, gaining 20,000 jobs in July.

Weekly Hours (Establishment Survey Data)
The average workweek of production or nonsupervisory workers on private nonagricul tural payrolls edged down 0.1 hour in July to 34.7 hours, seasonally adjusted. Manufacturing hours remained at very high levels. The workweek was at 41.0 hours for the third month in a row, and factory overtime edged back up to 3.8 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls increased 0.3 percent to 120.3 ( $1977=100$ ), seasonally adjusted. Reflecting July's employment gains, the manufacturing index rose by 0.5 percent to 93.7. (See table B-5.)

Hourly and Weekly Earnings (Establ ishment Survey Data)
Average hourly earnings and average weekly earnings were little changed on a seasonally adjusted basis in July. Prior to seasonal adjustment, hourly earnings dec reased by 1 cent to $\$ 8.91$, and weekly earnings were down 35 cents to $\$ 311.85$. (See table B-3.)

The Hourly Earnings Index (Establishment Survey Data)
The Hourly Earnings Index (HEI) was 173.2 (1977=100) in July, seasonally adjusted, an increase of 0.2 percent from June. For the 12 months ended in July, the increase was 2.4 percent. The HEI excludes the effects of two types of changes unrelated to underlying wage rate movements--fluctuations in manufacturing overtime and interindustry employment shifts. In dallars of constant purchasing power, the HEI decreased 1.4 percent during the 12 -month period ended in June. (See table B-4.)

The Enployment Situation for August 1987 will be released on Friday, September 4, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 59,500 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 290,000 establishments employing over 38 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th , which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-\mathrm{I}$ and the most comprehensive yields U-7. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 b$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not:
- The houschold survey is limited to those 16 years of age and older; the establishment survey is not limited by age:
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bls. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. The January revision is applied to data that have been published over the previous 5 years. For the establishment survey, updated factors for seasonal adjustment are calculated only once a year, along with the introduction of new benchmarks which are discussed at the end of the next section.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bls in its analyses-the error for the monthly change in total employment is on the order of plus or minus 328,000 ; for total unemployment it is 220,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .26 percentage point; for teenagers, it is 1.25 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, blS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by bls. It is available for $\$ 8.50$ per issue or $\$ 22.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or moniey order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables $\mathbf{B}$ through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Arm-
ed Forces; published data are limited to those 30 to 44 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

Table B-2. Average weekly hours of production or nonsupervisory workers' on private nonagricultural payrolls by industry

Data relate to production workers in mining and manufacturing; to construction workers in construction; and to nonsupervisory workere in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estats; and services. These groups account for approximately four-fifthe of the total employees on private nonagricultural payrolls.

- This series is not published seasonally adjusted since the seasonal component is small relative to the trend-cycle andfor irregular components and consequently cannot be separated with sufficient precision.
$\mathrm{p}=$ prellminary.
