USDL 89-335
TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMRARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, JULY 7, 1989

THE EMPLOYMENT SITUATION: JUNE 1989
Unemployment was little changed in June, and employment rose moderately, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The overall unemployment rate was 5.2 percent and the civilian worker rate was 5.3 percent; they had been 5.1 and 5.2 percent, respectively, in May.

Nonagricultural payroll employment--as measured by the survey of business establishments--increased by 180,00Q in June, seasonally adjusted, about in line with recent gains. However, the number of jobs in the goods-producing sector declined by 50,000 . Total civilian employment-as measured by the survey of households--rose by 325,000 over the month.

## Unemployment (Household Survey Data)

The number of unemployed persons, 6.6 million, and the civilian worker unemployment rate, 5.3 percent; were little changed in June, after seasonal adjustment. Both series were also at about the same levels as a year earlier. (See table A-2.)

The jobless rates for adult men (4.3 percent), adult women ( 4.9 percent), teenagers ( 15.6 percent), whites ( 4.5 percent), and Hispanics ( 8.1 percent) were essentially unchanged from the previous month. There was an increase in the rate for young adult workers (20-24 year-olds), from 7.7 to 8.9 percent: Black workers ( 11.9 percent) also experienced an increase in their unemployment rate, as there was a rise in joblessness among young black women. (See tables A-2, A-3, and A-9.)

The median duration of unemployment, at 5.5 weeks, was about unchanged from the previous month and was down only slightly over the year. Average (mean) duration of unemployment declined seven-tenths of a week in June to a seasonally adjusted level of 11.1 weeks. This measure has fallen by more than 2 weeks over the past year, largely due to a decline in the number of long-term unemployed. The number of newly unemployed persons, those jobless for less than 5 weeks, rose to 3.3 million in June, after having held at 3.0 or 3.1 million for most of the last year and a half. Paralleling this was an increase of 200,000 in unemployed reentrants to the labor force. (See tables A-7 and A-8.)

## Civilian Employment and the Labor Force (Household Survey Data)

Civilian employment increased by 325,000 in June to a seasonally adjusted level of 117.5 million , as the employment-population ratio-the proportion of the population that is employed--reached a new high of 63.1 percent. Over the past year, employment has risen by 2.5 million. (See table A-2.)

Table A. Major indicators of labor market activity, seasonally adjusted

The civilian labor force increased by 490,000 in June to a seasonally adjusted level of 124.1 million . The labor force participation rate, at 66.6 percent, was at a-record high. Over the year, the civilian labor force has risen by 2.5 million, 1.5 million of which occurred among adult women and 1.2 million among adult men. (See table A-2.)

## Discouraged Workers (Household Survey Data)

The quarterly estimate of discouraged workers--persons who want to work but have not looked for jobs because they believe they cannot find any-was about unchanged in the April-June period, at a seasonally adjusted level of 870,000. Blacks accounted for 37 percent of discouraged workers, even though they make up only 11 percent of the civilian working-age population. (See table A-14.)

## Industry Payroll Employment (Establishment Survey Data)

Total nonagricultural payroll employment rose by 180,000 in June to a level of 108.5 million, seasonally adjusted. This gain was about the same as the increase for the previous month, as revised, and occurred entirely within the service-producing sector. (See table B-1.)

In the goods sector, employment decreased by 50,000 in June, returning the job total to its January level. Manufacturing employment fell for the third consecutive month and was 50,000 below the March level. Employment in auto manufacturing was down by 15,000 , as production was cut back because of large inventories. Employment in the electrical equipment industry continued its downward trend; since November, the industry has lost 30,000 jobs. There were also small but widespread over-the-month declines in other industries, particularly in the durable goods sector. One exception to this pattern of job loss was the machinery industry, where employment has continued to increase in each month of 1989, although at a slower pace than in 1988.

The number of mining jobs fell over the month, as about 10,000 workers were off payrolls for the entire reference period due to labor-management disputes. Construction employment was little changed for the second straight month.

The service-producing sector continued to show job gains. Employment in the services industry itself rose by 160,000 in June, with business and health services both posting large increases. Employment in the transportation industry, which had increased on a consistent basis for the last 3 years, rose by another 20,000. Insurance and real estate jobs continued to rise. After exhibiting strong-to-moderate growth during 1988 and early this year, employment levels were little changed in both wholesale and retail trade.

## Weekly Hours (Establishment Survey Data)

Average weekly hours for production or nonsupervisory workers on private nonagricultural payrolls, at 34.6 hours in June, seasonally adjusted, were unchanged over the month. The manufacturing workweek decreased by 0.1 hour to 40.9 in June, while factory overtime ( 3.8 hours) was unchanged. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls, at $127.8 \quad(1977=100)$, increased by 0.2 percent, after seasonal adjustment. The index for manufacturing declined 0.3 percent to 96.2 , due to the drop in both the hours and employment levels. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Both the average hourly and weekly earnings of private production or nonsupervisory workers were about unchanged in June, after seasonal adjustment. Prior to seasonal adjustment, average hourly earnings inched down by 1 cent to $\$ 9.58$ and average weekly earnings increased by $\$ 1.57$ to $\$ 332.43$. Average hourly earnings rose 3.8 percent over the past year. (See tables B-3 and B-4.)

The Employment Situation for July 1989 will be released on Friday, August 4, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 55.800 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 300,000 establishments employing over 38 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th , which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitlons, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields $\mathrm{U}-7$. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 \mathrm{~b}$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces:
- The houschold survey includes people on unpaid leave among the employed: the establishment survey does not;
- The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the sls upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percen! of the month-to-month changes in unemployment.

Because these seasonal evens follow a more or less regular pattern each year, their intluence on statistical irends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to pot. To return to the school's-out example. the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable channe. Insofar as the seasonal adjusiment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bis. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces toral (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are calculated for 6 months, along with the introduction of new benchmarks, which are discussed at the end of the next section, and again with the release of data for October. In both surveys, revisions to data published over the previous 5 years are made once a year.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the result, of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bls in its analyes-the error for the monthly change in total employment is on the order of plus or minus 358,000 ; for total unemployment it is 224,000: and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also. as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the cstimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .25 percentage point; for teenagers, it is 1.29 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BL.S regularly publishes a wide variety of data in this news release. Mòre comprehensive stati, tics are contained in Employment and Earnings, published each month by Bls. It is available for $\$ 8.50$ per issue or $\$ 25.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables $B$ through $J$ of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

The population figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.

Civilian employment as a percent of the civilian noninstitutional
population.
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.
