TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, AUGUST 4, 1989

## THE EMPLOYMENT SITUATION: JULY 1989

Payroll employment continued to increase in July and unemployment was little changed, the Bureau of Labor Statistics of the U. S. Department of Labor reported today. Both the overall jobless rate and that for civilian workers were 5.2 percent.

Nonagricultural payroll employment, as measured by the survey of business establishments, rose by 170,000 . Jobs in the private sector (excluding government) increased by 195,000. Total civilian employment, as measured by the survey of households, showed little change over the month.

## Unemployment (Household Survey Data)

The number of unemployed persons, 6.5 million , and the civilian worker unemployment rate, 5.2 percent, were virtually unchanged in July, after seasonal adjustment. In fact, the civilian worker rate has been either 5.2 or 5.3 percent. for 4 consecutive months. Jobless rates for adult men ( 4.3 percent), adult women ( 5.0 percent), and whites ( 4.6 percent) held steady from the previous month. There was a small decline among teenagers (to 14.7 percent). The rate for Hispanic workers ( 9.0 percent) rose, while that for black workers 10.9 percent) showed a decrease, largely because the quite volatile rate for black teenagers (27.4 percent) fell markedly. (See tables A-2 and A-3.)

The number of persons working part time for economic reasons--sometimes referred to as the partially unemployed--was at a seasonally adjusted level of 4.8 million in July. This series has been trending down over the past year. (See table A-4.)

Civilian Employment and the Labor Force (Household Survey Data)
Total civilian employment was essentially unchanged in July at a seasonally adjusted level of 117.5 million. The proportion of the working-age population that is employed (the employment-population ratio) was 63.0 percent, about where it has been for the past 7 months. Civilian employment has grown by 2.4 million over the past year. (See table A-2.)

Table A. Major indicators of labor market activity, seasondidvamdinetan

The civilian labor force, at 124.0 million, and the labor fonce participation rate, 66.5 percent, were also about unchanged from the previous month. Over the past year, the civilian iabor force has risen by 2.4 million, as the number of adult women and men in the labor force expanded by 1.6 million and 1.0 million , respectively, while the number of teenagers--a declining population group--fell by 270,000. (See table A-2.)

## Industry Payrol 1 Employment (Establishment Survey Data)

Total nonagricultural payroll employment rose by 170,000 in July to a level of 108.7 million, seasonally adjusted. Private sector employment rose by 195,000 . Over the past year, payroll jobs have increased by 2.9 million. (See table B-1.)

In the goods-producing sector, job growth was confined to the construction industry, where employment rose by about 35,000 in July, after being about unchanged during the prior 2 months. Mining employment was down for the second month in a row, due to labor-management disputes.

In manufacturing, employment held steady in July, following 3 consecutive months of decline. Increases in nondurable goods, particularly in food processing, were offset by decreases in durable goods industries. The durable goods sector has lost 55,000 jobs over the past 4 months, thus reversing much of the job growth that occurred in late 1988 and early 1989. Employment in the auto industry dropped sharply for the second straight month, losing over 10,000 jobs in July, as companies continued to slow production because of large inventories and slow sales. Enployment in the electrical equipment industry continued its downward trend. The machinery industry, however, showed a small increase.

In the service-producing sector, jobs in the services industry grew by a modest 75,000 , following a gain of 210,000 in the prior month. The health services component rose by 30,000 , while business services was about unchanged. Retail trade rose by 50,000 over the month, with the largest increases occurring in food stores and eating and drinking places. The transportation industry continued to exhibit strength, with an addition of 25,000 jobs. Employment in finance, insurance, and real estate rose by 10,000 in July. Little employment growth occurred in wholesale trade. Recent employment growth in this industry has been at a much slower pace than earlier in the year.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonagricultural payrolls increased 0.3 hour to 34.9 hours, seasonally adjusted. The manufacturing workweek held at 41.0 hours, while factory overtime, at 3.9 hours, was up 0.1 bour. (See table B-2.)

Mainly reflecting the increase in the workweek, the index of aggregate weekly hours of production or nonsupervisory workers on private nonagricultural payrolls increased by 1.1 percent to $129.4(1977=100)$, after seasonal adjustment. The index for manufacturing rose slightly over the month to 96.5 . (See table g-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers increased 0.8 percent in July, seasonally adjusted, while average weekly earnings climbed by 1.7 percent. The large increase in hourly earnings followed 2 months of very small changes. Prior to seasonal adjustment, average hourly earnings increased by 5 cents to $\$ 9.63$ and average weekly earnings jumped $\$ 4.63$ to $\$ 338.01$. Over the year, both average hourly earnings and average weekly earnings increased by 4.2 percent. (See tables B-3 and B-4.)

The Employment Situation for August 1989 will be releasd on Friday, September 1, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents stalistics from two major surveys, the Current Population Surtey (household survey) and the Current Employment Statistics Sursey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. it is a sample survey of about 55.800 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and carnings of workers on nonagricultural payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by 81 s in cooperation with State agencies. The sample includes over $300,0001 /$ establishments employing over 38 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 121 h day of the monih, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12th, which may or may not correspond direetly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable vatiance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences <br> between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each ;erson in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United Slates are also included in the employed total.

People are classified as unemployed. regardiess of their eligibility for unemployment benefins or public assistance, if they meet atl of the following criteria: They had no employment during the survey week: they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed peopte in the labor force (sivilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields U-7. The overall unemployment tate is $\mathrm{U}-5 \mathrm{sa}$, while $\mathrm{U}-\mathrm{Sb}$ represents the same measure with a civilian labor force base.

Unlike the househuld survey. the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The houxhold surse, although based on a smaller sample, reflects a larger wegment of the populationt; the evtahlushment suritey exelades agriculture, the will-employed. unpaid family workers. private househobd workers., and members of the esident Armed forces:
- The housthowd sursey includer neople on unpad kease among the employed: the extablishment wivey doss nol:
- Thr hounchold wrvey is limited Io inove 16 vears of apt and older: the exablingment warvey is not limuled hy age:
- The household survey has no duplacation of indisiduals, because each indinidual is comoned only once; in the establivhment survey, employees working at more than ore job of otherwise appeating on more than one payrall would be counted eppatately for each appearance.
Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obrained from the blS upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these veavonal event, follow a more or lew regular patiern each year, their influcnce on sativticat trend can be climinated by adjusing the sativita from month to month. These adjuiments make nonseasonal deselopments, weth as declines in economic activity or increases in the participation of women in the labor force, casier to spot. To return to the school'toout example, the large number of people entering the labor force each June is likely to obscure any olher changes thar hare taken place since May, making it difficult to determine if the level of economic activity hat risen or declined. However, because the effect of sudent finishing school in previoum years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correstly, the adjusted figure provides a more uneful tool with which 10 analyge changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statisties for ald employees, production workers, aserage weekly hours, and average hourly earnings include components based on the employer's industry. All these stativics can be seasonally adjusted either by adjusting the $10 t a l$ or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bis. For example, the reasonaily adjusted figure for the labot force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonaliny), and four seasonally adjusted unemployment componenss; the total for unemployment is the sum of the four unemployment components: and the overall unemployment rate is derived by dividing the resuling estimate of total unertployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey. updated factors for seasonal adjustment are calculated for 6 moniths, along with the introduction of new benchmarks, which are discussed at the end of the next section, and again with the release of data for October. In both surveys, revisions to data published over the previous 5 years are made once a year.

## Sampling variability

Stanistics based on the household and establistument surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ fromt the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the househoid survey, the atmount of the differences can be expressed in terms of sandard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error

Irom the resuls of a complete census. The chances are approximately 90 out of 100 that an entimate based on the vample will differ hy no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limiss used by is $s$ in its analves-the crror for the monthly change in total employ* ment is on the orden of plus or minus 358.600; for totak unemployment it is 224,000 , and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample rexulis are off by these magnitudes but. rather. that the chance are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimate by more than these amoumts.

Sampling errors for monthly surveys are reduced when the data are cumulated For several months, such as quarterly or anmually. Also, as a general rule, the smaller the estimate. the larger the sampling error. Therefore, relatively speaking, the extmate of the sire of the tabor force is subject to less error than is the evimate of the number unemployed. And, among the unemployed. the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the johless rate of teenagers. Specifically, the errot on monthly change in the jobless rate for men is .25 percentage point: for teenagers, it is 1.29 percentage points.

In the extablishmen survey, estimates for the 2 mosi cursent months are based on incomplete returns; for this reason, these entimate are labeled preliminary in the tables. When all the resurns in the sample have been received, the estimates are revised. In other words, data for the month of September are nublished in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducied each year. The results of this survey are used to establish new benchmarks-comprehensive counts of emplogment-against which month-to-month changes can be measured. The new benchmasks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment siruation, his regularly publishes a wide variety of data in this neus release. More comprehensive statistics are contained in Emplowment and Earnings, published each month by bls It is available for $\$ 8.50$ per issue or $\$ 25.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Emplovment and Earmings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustrnents are provided in tables A, O, P. and Q of that publication.

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Armed Forces; published data are limited to
those 30 to 44 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population.

[^4]Table B-2. Average weekly hours of production or nonsupervisory workersl' on private nonagricultural payrolls by industry

$1 /$ Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale end retail trade; fínance; insurance, and real estate; and services. These groups account for approximately four-fifths of the tatal employees on privete nonagricultural payrolls.
2) These series are not published seasonally adjusted since the seasonal component is small relative to the trend-cycle andior irregular components and consequently cannot be separated with sufficent precision. p = preliminary. -

Table B-3. Average hourly and weekly earnings of production or nonsupervisory workersl/ on private nonagricuitural payrolls by industry

1/ See footnote 1, table B-2.

## 1/See lootnote 1 , table B-2.

$2 /$ Includes mining, not shown separately, because its seasonal component is too small to be separated out with sufficient precision. 3/ The Consumer Price Inde: for Urban Wage Earners and Clerical Workers (CPI-W) is used to deflate this series.

4/ Real earnings were unchanged from May to June 1989, the latest month available.
5/ Derived by assuming that overtime hours are paid at the rate of time and one-half.
N.A. = not available.
$\mathrm{p}=$ preliminary.

$1 /$ See footnote 1, table B-2.
p = preliminary.

Table B-6. Diffusion indexes of employment change, seasonally adjusted
(Percent)

1/ Based on seasonally adjusted data for 1-, 3-, and 6-montr: spans and unadjusted data for the
12 -month span. Data are centered within the span.
p=preliminary.
HOTE: Figures are the percent of industries with
employment increasing plus one- half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

[^0]:    ' Unemployment as a percent of the civilian labor force.
    Aggregate hours lost by the unemployed and persons on part time for

[^1]:    economic reasons as a percent of potentially available labor force hours

[^2]:    ${ }^{2}$ Civilian employment as a percent of the civilian noninstitutional population.

[^3]:    ' These are the official Bureau of Labor Statistics' estimates used in the administration of Federal fund allocation programs.
    ${ }^{2}$ The population figures are not adjusted for seasonal variation; therefore,

[^4]:    p a preliminary.
