USDL 90-279
TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, JUNE 1, 1990

THE EMPLOMMENT SITUATION: MAY 1990

Employment showed little growth in May and unemployment was about unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Both the overall jobless rate and the civilian worker rate were 5.3 percent. There have been few changes in unemployment for over a year and a half.

Private sector employment, as reported by the survey of business establishments, was about unchanged in May, the third successive month of weakness. Government employment rose by 155,000; nearly all of this increase resulted from additional hiring of temporary workers to assist with the 1990 decennial census. Total civilian employment, as measured by the survey of households, rose by 230,000 in May, following a decline of a similar magnitude in April.

Unemployment (Household Survey Data)
The number of unemployed persons, 6.7 million, and the civilian worker unemployment rate, 5.3 percent, were essentially unchanged in May, after seasonal adjustment. The rate has hovered between 5.0 and 5.4 percent for the past 21 months. Jobless rates for all major worker groups-adult men (4.7 percent), adult women ( 4.6 percent), teenagers ( 15.5 percent), whites ( 4.6 percent), blacks (10.4 percent), and Hispanics ( 7.7 percent)--also showed little or no change in May. (See tables A-2 and A-3.)

The median duration of unemployment edged up in May to 5.4 weeks. About 1.4 million, or 1 in 5 unemployed workers, had been jobless for 15 weeks or longer, a situation that has prevailed for the past year and a half. (See table A-7.)

## Civilian Employment and the Labor Force (Household Survey Data)

Total civilian employment rose by 230,000 in May to a seasonally adjusted level of 118.4 million. The proportion of the working-age population that is employed (the employment-population ratio) was little changed at 63.0 percent; it has fluctuated around this high level for the past 15 months. (See table A-2.)

The civilian labor force, at 125.0 million , and the labor force participation rate, at 66.6 percent, were little changed over the month.

Table A. Major indicators of labor market activity, seasonally adjusted

1/ Includes the resident Armed Forces.
p=preliminary. N.A. $=$ not available.

Over the past 12 months, the labor force has increased by 1.4 million, with adult women accounting for about 70 percent of the gain. (See table A-2.)

## Industry Payroll Employment (Establishment Survey Data)

With the addition of an estimated 145,000 temporary census workers, total nonfarm payroll employment increased by 165,000 in May to a level of 110.6 million, after seasonal adjustment. Private payrolls, however, were little changed, following a loss of 125,000 jobs (as revised) in the previous month. (See table B-1.)

In May, the goods-producing sector suffered employment declines for the seventh month out of the last nine. Manufacturing employment fell by 35,000, with small losses throughout both the durable and nondurable goods components. Since reaching a post-recession peak in March 1989, 310,000 factory jobs have been lost; industries hardest hit include electrical equipment ( $-85,000$ ), motor vehicles ( $-55,000$ ), apparel ( $-50,000$ ), fabricated metals ( $-35,000$ ), and textile mills ( $-25,000$ ). Reflecting continued weakness in the housing market, the construction industry added fewer workers than usual in May, resulting in a seasonally adjusted employment decline of 20,000 . Mining employment rose slightly and has increased by 35,000 over the past year.

In the service-producing sector, government jobs rose by 155,000 , with almost all of the net additions being temporary census workers. Elsewhere in the sector, employment in wholesale trade increased by 15,000 in May, with most of the increase in the nondurable goods component. For the second straight month, employment was little changed in transportation and public utilities and in finance, insurance, and real estate. Retail trade payrolls were also unchanged in May. Employment in this industry has been weak for the past 4 months, particularly in its general merchandise stores component, where 55,000 jobs have been lost. In the services industry, employment rose by only 35,000 , following a small decline in the previous month. May gains were concentrated in health services, which added 45,000 workers; over the past year, health services accounted for half of the employment gain in the services industry and a third of the increase in total private jobs.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls was unchanged in May at 34.6 hours, seasonally adjusted, and has shown little movement thus far in 1990. The manufacturing workweek rose 0.4 hour in May to 41.1 hours, as factory overtime climbed 0.5 hour to 4 hours. These increases were paced by large gains in overtime hours that were principally in the durable goods sector, particularly in motor vehicles and steel. (See table B-2.)

The index of aggregate weekly hours of private production or nonsupervisory workers was unchanged in May at 130.0 (1977=100), after seasonal adjustment. The manufacturing index rose 0.7 percent to 94.8 , as the increase in hours more than offset the decline in employment. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Lata),
Both hourly and weekly earnings of production or nonsupervisory workers on private nonfarm payrolls rose 0.4 percent in May, on a seasonally adjusted basis. Prior to seasonal adjustment, averag̣e hourly earnings rose 2 cents to $\$ 9.98$ and average weekly earnings advanced 69 cents to $\$ 344.31$. Both series increased by 4.1 percent over the past 1.2 months. (See tables B-3 and B-4.)

## Note on Establishment Survey Data

Establishment survey data will be revised based on 1989 benchnark levels with the release of August data in September. The revision will also incorporate the 1987 Standard Industrial Classification codes.

The Employment Situation for June 1990 will be released on Eriday, July 6, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (Bls).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonagricultural payrolls that appears in the $B$ tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by blS in cooperation with State agencies. The sample includes over 300,000 establishments employing over 38 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and difierences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equais the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields U-7. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 \mathrm{~b}$ represents the same measure with a civilian labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonagricultural firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, private household workers, and members of the resident Armed Forces;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;
- The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
-. The household survey has no duplication of individuals, because each individual is counted only once: in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll wouid be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the blS upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics Irom month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BI s. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.
The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are calculated for 6 months, along with the introduction of new benchmarks, which are discussed at the end of the next section, and again with the release of data for October. In both surveys, revisions to data published over the previous 5 years are made once a year.

## Sampling variability

Statistics based on the household and establishment.survey: are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approxinately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bi.s in its analyses-the error for the monthly change in total employment is on the order of plus or minus 358,000; for total unemployment it is 224.000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "Irue" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .25 percentage point; for teenagers, it is 1.29 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, Bis regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BL.S. It is available for $\$ 8.50$ per issue or $\$ 25.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Emplowment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

' The population figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.
${ }^{2}$ Civilian employment as a percent of the civilian noninstitutional
population.
NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

NOTE: Male Vietnam-era veterans are men who served in the Armed Forces between August 5, 1964 and May 7, 1975. Nonveterans are men who have never served in the Armed Forces; published data are limited to those 35 to 49 years of age, the group that most closely corresponds to the bulk of the Vietnam-era veteran population. Data for 30 -to 34 -year-old
veterans are no longer shown in this table because the group is rapidly disappearing (into the 35-39 age category) and the numbers remaining for some labor force categories are not large enough to warrant their continued publication.

' These are the official Bureau of Labor Statistics' estimates used in the administration of Federal fund allocation programs.
${ }^{2}$ The population figures are not adjusted for seasonal variation; therefore,
identical numbers appear in the unadjusted and the seasonally adjusted columns.

Table B-1. Employees on nonagricultural payrolls by industry (In thousands)

## Note on temporary census workers

The number of temporary workers associated with the 1990 census has an impact on the employment levels for the Federal government, as well as for higher aggregates. The estimate of these workers was 22,000 in January, 27,000 in February, 117,000 in March. and 178,000 in April. For May, the estimated number (prelimınary) was 325,000 , which may be subject to significant revision.
