TRANSMISSION OF MATERIAL IN THIS release is bmbargoed until B:30 A.M. (FST), FRIDAY, MARCH 8, 1991

THE EMPLOYMENT SITUATION: FEBRUARY 1991

Employment continued to decline in February and unemployment rose sharply, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The civilian worker unemployment rate was 6.5 percent, up from 6.2 percent in January and 5.3 percent last June.

Nonfarm payroll employment, as measured by the survey of business establishments, fell by 185,000 in February, as manufacturing, transportation, and retail trade experienced particularly large job losses. Total civilian employment, as measured through the household survey, was unchanged, following a large decline in January.

Unermployment (Household Survey Data)
The number of unerployed persons increased by 440,000 in February to a level of 8.2 million (after seasonal adjustment), and the civilian worker unemployment rate rose to 6.5 percent. This was the highest rate since March 1987. Since June of last year, the number of jobless workers has climbed by 1.6 million, and the unemployment rate has risen by 1.2 percentage points. (See table A-2.)

Adult men accounted for the upward movement in unemployment in February. Their jobless rate rose sharply, from 5.6 to 6.3 percent, while the rates for adult women ( 5.4 percent) and teenagers ( 17.1 percent) were little changed. Among the race-ethnic groups, the unemployment rate for whites rose from 5.5 to 5.9 percent, while those for blacks ( 11.8 percent) and Hispanics ( 9.5 percent) were essentially unchanged. The jobless rates in two male-dominated industries-construction and durable goods manufacturing-continued to rise in February. Over the past year, the workers in these industries experienced by far the greatest increases in unenployment. (See tables A-2, A-3, and A-5.)

The number of unemployed persons who lost their last jobs rose by 450,000 in February to 4.5 million. This figure has risen by 1.4 million since last July. Job losers now comprise 55.5 percent of the unemployed, the highest proportion since October 1983. (See table A-7.)

The number of persons working part time for economic reasons-scmetimes called the underemployed or partially unemployed-increased by 550,000 to 6.1 million in February. This figure has risen substantially from the 4.9 million level that generally prevailed throughout the first. half of 1990. (See table A-4.)

$\overline{\text { N.A. }}$. not available.

## Civilian Employment and the Labor Force (Household Survey Data)

Following a decline of 650,000 in January, total civilian employment was unchanged in February at 116.9 million, seasonally adjusted. The percentage of the working-age population that is employed (the employmentpopulation ratio) was 61.8 percent in February, down from 63.0 percent a year earlier. (See table A-2.)

The civilian labor force, which has shown erratic movements in recent months, increased by 440,000 in February to 125.1 million. Over the past year, however, the civilian labor force has grown by a modest 630,000-an increase of only 0.5 percent. The labor force participation rate--the proportion of the working-age population that is either employed or actively seeking employment-was 66.1 percent in February, little different from the previous month and 0.4 percentage point lower than a year earlier. (See table A-2.)

## Industry Payroll Employment (Establishment Survey Data)

Nonfarm payroll employment decreased by 185,000 in February to 109.6 million. The bulk of the decline occurred in manufacturing, and there were also substantial losses in retail and wholesale trade and in transportation and public utilities. For the seventh consecutive month, more industries had declines than increases. (See tables B-1 and B-6.)

Manufacturing employment fell by 125,000 in February, continuing a downard trend which started 2 years ago. Since January 1989, the number of factory jobs has decreased by over 1 million. Manufacturing job losses in February continued to be concentrated in durable goods, particularly in industrial machinery, autos and other transportation equipment, and fabricated metals. Smaller declines occurred among industries tied to construction--lumber and wood products and furniture and fixtures--as well as in primary metals and electronic equipment. In nondurable goods, small job losses took place in textiles and rubber and plastics. The only manufacturing industry in which there was an over-the-month employment gain was food processing, which has added more than 20,000 jobs in the last 8 months.

Despite relatively mild weather in February, construction employment showed only a slight rebound from the drop of 150,000 in the prior month (seasonally adjusted). The recent string of job losses in this industry totals about 425,000 since last May.

The service-producing sector also lost jobs in February. Enployment in retail trade fell by 70,000 , after seasonal adjustment. In transportation, there was a 35,000 cutback, reflecting temporary layoffs and job terminations in the airline industry and continued declines in trucking. Also, employment declined by 25,000 in wholesale trade and 10,000 in finance, insurance, and real estate. Retail and wholesale trade combined has lost a total of 350,000 jobs since last summer.

The services industry, which had been growing robustly until late last year, has shown only small employment gains for the past 3 months. Health services has continued to grow, but at a more moderate pace, with an increase of 30,000 jobs in February. There was a further job decline $(20,000)$ in business services, where reductions have totaled 75,000 since last September.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls edged up by 0.2 hour in February to 34.3 hours, seasonally adjusted, following a decline of 0.5 hour in January. The manufacturing workweek declined by 0.2 hour from its revised January level to 40.2 hours, and factory overtime edged down to 3.3 hours. The manufacturing workweek and overtime have been trending downward in recent months. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers increased by 0.3 percent to 122.3 (1982 $=100$ ) in February, seasonally adjusted, as a result of the slight increase in hours. The index for manufacturing declined by 1.2 percent to 101.0 , seasonally adjusted. Over the year, the index for manufacturing was down by 6.1 percent. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers were unchanged at $\$ 10.20$, seasonally adjusted. Average weekly earnings increased by 0.6 percent to $\$ 349.86$. Prior to seasonal adjustment, average weekly earnings were up by $\$ 1.03$. Over the past year, average hourly earnings increased by 3.3 percent and average weekly earnings by 2.4 percent. (See tables $\mathrm{B}-3$ and $\mathrm{B}-4$. )

The Employment Situation for March 1991 will be released on Friday, April 5, at 8:30 A.M. (EST).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, total employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the $B$ tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 340,000 establishments employing over 40 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all as paid civilians; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, disputes between labor and management, or personal reasons. Members of the Armed Forces stationed in the United States are also included in the employed total.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employ. ment during the survey week; they were available for work at
that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the percentage of unemployed people in the labor force (civilian plus the resident Armed Forces). Table A-5 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields U-7. The overall unemployment rate is $\mathrm{U}-5 \mathrm{a}$, while $\mathrm{U}-5 \mathrm{~b}$ represents the same measure with a civilian labor force base.
Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonfarm firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a
larger segment of the population; the establishment survey excludes agriculture,
the selfemployed, unpaid family workers, private household workers, and members of the resident Armed Forces;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;
- The household survey is limited to those 16 years of age and older; the establishment survey is not limited by age;
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences berween the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from the BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the Nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by bls. For example, the seasonally adjusted figure for the labor force is the sum of eight seasonally adjusted civilian employment components, plus the resident Armed Forces total (not adjusted for seasonality), and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the overall unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the labor force.

The numerical factors used to make the seasonal adjustments are recalculated regularly. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are also calculated twice a year. In both surveys, revisions to historical data are made once a year.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error
from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by bls in its analyses-the error for the monthly change in total employment is on the order of plus or minus 358,000 ; for total unemployment it is 224,000 ; and, for the overall unemployment rate, it is 0.19 percentage point. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.
Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .25 percentage point; for teenagers, it is 1.29 percentage points.

In the establishment survey, estimates for the 2 most current months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the Nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 8.50$ per issue or $\$ 25.00$ per year from the U.S. Government Printing Office, Washington, D.C., 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

1 The population and Armed Forces figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.
2 includes members of the Armed Forces stationed in the United States.

## Note on Armed Forces estimates

Estimates of the labor force including the Armed Forces that appear in table A-1 of this release should be interpreted with caution. The recent transfer of active-duty personnel to the Persian Gulf and the callup of reservists are not fully reflected in the current estimates of the size of the resident Armed Forces. These data come from administrative sources and are affected, among other things, by the practice of most branches of the services to treat current deployments as tempo-rary-duty assignments. In addition, the civilian population estimates may be slightly overstated, because it is not possible for the Bureau of Labor Statistics to reflect fully the recent callup of civilian reservists. The Bureau believes, however, that this situation has had no appreciable effect on the civilian labor market daid.

1. Data relate to production workers in mining and manufacturing: construction, workers in construction; manufacturing: construction workers in construct and nonsupervisory workers in transportation and pubic utilities; wholesale and retail trade; tinance, account for approximately four-fifths of the total employees on private nonfarm payralls.
2) These series are not published seasonally
adjusted since the seasonal component is small relative to the trend-cycle and or irregular components and consequently cannot be separated with sufficient precision.

Table B-3. Average hourly and weekly earnings of production or nonsupervisory workersl/ on private nonfarm payrolls by industry
