TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, MAY 8, 1992

THE EMPLOYMENT SITUATION: APRIL 1992

Employment rose in April and unemployment was about unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The nation's jobless rate was 7.2 percent, compared with 7.3 percent in both February and March.

Nonfarm payroll employment, which had begun to show a little growth in recent months, rose by 126,000 in April, with the gain concentrated in services and retail trade. Total employment, as estimated through the household survey, continued its uptrend with an increase of 327,000.

## Unemployment (Household Survey Data)

Both the number of unemployed persons, 9.2 million, and the unemployment rate, 7.2 percent, were little different from their March levels. Jobless rates were somewhat lower in April, however, for teenagers ( 19.2 percent), whites ( 6.3 percent), and Hispanics ( 10.3 percent). Rates for adult men ( 6.8 percent), edult women ( 6.3 percent), and blacks (13.9 percent) were about unchanged over the month. (See tables A-1 and A-2.)

The number of persons jobless for 15 weeks or longer dropped back by 167,000 in April to 3.0 million. This was still about twice the number of long-term jobless as when the recession began in July of 1990 . (see table A-5.)

The number of persons working part time for economic reasons-sometimes referred to as the partially unemployed--declined by 227,000 to 6.3 million in April. This measure has declined by about 450,000 since January. (See table A-3.)

## Total Employment and the Lobor Force (Household Survey Data)

Total employment continued its strong upward trend of recent months; at 117.7 million, it was up by 327,000 in April. Since December, the number of employed persons has risen by an estimated 950,000. The employment-population ratio--the percentage of the working-age population that is employed-rose to 61.6 percent, the highest level since last September. (See table A-1.)

The civilian labor force edged up by 240,000 in April to a level of 126.8 million. Since November, the labor force has grown at a brisk pace of 290,000 a month, after showing very little growth from the onset of the recession. The labor force participation rate--the percentage of the working-age population that is either employed or unemployed--held steady at 66.3 percent in April but was up half a percentage point from last November's figure. (See table A-1.)

## Industry Payroll Employment (Establishment Survey Data)

Nonfarm payroll employment grew by 126,000 in April, after seasonal adjustment, with nearly all the gains taking plece in services and retail trade. The increase marks the third consecutive month of small gains in payroll employment totaling 270,000 since January. (See table B-1.)

The service-producing sector added 135,000 jobs in April, its largest single-month increase since June of 1990 . The services industry dominated April's gain by adding 72,000 jobs, following weak growth in the prior 3 months. Business services added jobs for the second straight month, and health services sustained its strong growth pattern. Retail trade also showed signs of renewed strength, as employment was up by 46,000. Wholesale trade employment was steady after falling in each of the previous 21 months.

Both manufacturing and construction employment were essentially unchanged in April. Nevertheless, more manufecturing industries added jobs than lost them for the first time since last August, as indicated by the diffusion index of employment change (table B-6). Construction employment has been essentially flat since December. The number of mining jobs continued to decline in April, with a drop of 5,000 in oil and gas extrection. The mining industry has lost 63,000 jobs since its most recent high of June 1990, a decline of nearly 9 percent.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls edged down by 0.1 hour in April to 34.4 hours. The manufacturing workweek was unchanged at a very high 41.1 hours. Factory overtime jumped by three-tenths of an hour to 4.0 hours, its highest level since February 1989. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers dropped three-tenths of a percent to $121.6(1982=100)$ after seasonal adjustment, following a similar drop in March. The index of manufacturing hours edged up a tenth of a percent to 102.7, its highest point since last September. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers were about unchanged in April at $\$ 10.54$, seasonally adjusted, while average weekly earnings edged down by $\$ 1.40$ to $\$ 362.58$. Prior to seasonal adjustment, average hourly earnings were about unchanged at $\$ 10.56$, and average weekly earnings declined by 72 cents to $\$ 361.15$. Over the year, average hourly earnings have risen by 2.5 percent and average weekly earnings by 3.1 percent. (See teble B-3.)

Revisions in the Establishment Survey Data
The Employment Situation news release of May data will introduce revisions in the establishment-based series on nonfarm payroll employment, hours, and earnings to reflect the regular annual benchmark edjustments and updated seasonal adjustment factors.

The Employment Situation for May 1992 will be released on Friday, June 5, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the cmployment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 350,000 establishments employing over 41 million people.
For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12th, which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.
People are classified as employed if they did any work at all as paid employees; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, labor-management disputes, or personal reasons.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the number unemployed as a percent of the civilian labor force. Table A-7 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $\mathrm{U}-1$ and the most comprehensive yields U-7. The civilian worker unemployment rate is U-5b, while U-5a, the overall unemployment rate, includes the resident Armed Forces in the labor force base.
Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonfarm firms. As a result, there are many differences between the two surveys, among which are the following:

- The houschold survey, although based on a smaller sample, reflects a larger segment of the population; the estabishment survey excludes agnculture, the self-employed, unpaid family workers, and private houschold workers;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;

The household survey is limited to those 16 years of age and older, the establishment survey is nox limited by age;

- The household survey has no duplication of individuals, because each individual is counted only once: in the establishment survey, employees working at more than one job or ohnerwise appearing on more than one payroil would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular patuern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable
change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly eamings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.
The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the JulyDecember period. For the establishment survey, updated factors for seasonal adjusment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 percent level of confidence--the confidence limits used by BLS in its analyses--the error for the monthly change in total employment is on the order of plus or minus 358,000 ; for total unemployment it is 224,000 ; and, for the civilian worker unemployment rate, it is 0.19 percentage points. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances
are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling enor for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .25 percentage point; for teenagers, it is 1.29 percentage points.
In the establishment survey, estimates for the most current 2 months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarkscomprehensive counts of employment-against which month-tomonth changes can be measured. The new benchunarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other Information

In order to provide a broad view of the nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 10.00$ per issue or $\$ 31.00$ per year from the U.S. Govemment Printing Office, Washington, DC 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $\mathrm{M}, \mathrm{O}, \mathrm{P}$, and Q of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-523-1221, TDD phone: 202-523-3926, TDD Message Referral Phone Number: 1-800-326-2577.
