TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL. 8:30 A.M. (EDT), FRIDAY, SEPTEMBER 4, 1992

THE EMPLOYMENT SITUATION: AUGUST 1992

Nonfarm payroll employment declined in August and unemployment was about unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The number of payroll jobs, which had increased in July, declined by 83,000 in August. Private payrolls fell by 167,000 , with especially large job losses in manufacturing and retail trade. At 7.6 percent in August, the jobless rate has come down slightly from its recent June high of 7.8 percent. The 2 -month decline, however, was essentially confined to teenagers.

## Unemployment (Household Survey Data)

Both the number of unemployed persons, 9.7 million, and the unemployment rate, 7.6 percent, were virtually unchanged in August from the prior month. The unemployment rate for teenagers ( 19.8 percent) improved slightly, while jobless rates for adult men ( 7.3 percent), adult women ( 6.5 percent), whites ( 6.6 percent), blacks (14.3 percent), and Hispanics (11.2 percent) all showed little or no movement. The decrease in the teenage unemployment rate was the second consecutive monthly decline, following a sharp rise in June, and reflects the impact of the special summer jobs program. (See tables A-1 and A-2.)

Two other key unemployment measures, the number of long-term unemployed and job losers, held at about their July levels. (See tables A-5 and A-6.)

Over the past year, the number of unemployed persons increased by 1.2 million and the rate rose by 0.8 percentage point. About two-thirds of the increase in unemployment has been emong persons who lost a job to which they do not expect to be recalled--"other job losers." (See table A-6.)

## Total Employment and the Labor Force (Household Survey Data)

At 117.7 million in August, total employment was about the seme as in the prior month. The employment-population ratio--the percentage of the working-age population that is employed--was 61.4 percent. The ratio has remained in a range from 61.2 to 61.6 percent since the spring of 1991 , well below the peak of 63.1 percent reached in March 1990 . (See teble

Table A. Major indicators of labor market activity, seasonally adjusted

The civilian labor force, at 127.4 million in August, was little changed from the June-July levels. Between last November and June, the labor force had grown by 2.2 million. The labor force participation rate-the percentage of the working-age population that is either working or looking for work--edged down to 66.4 percent from its all-time high of 66.6 percent last reached in the prior 2 months. (See table A-1.)

Industry Payroll Employment (Establishment Survey Data)
Nonfarm payroll employment declined by 83,000 in August, despite further increases in local government jobs. Excluding government, payroll employment declined by 167,000 in August, following a 95,000 gain in the prior month. The large increases in local government employment--63,000 in July and 88,000 in August--reflected the special Federally funded summer youth job programs. (See table B-1.)

Manufacturing employment declined sharply in August, falling by 97,000. This was the second decrease in the last 3 months, following a short period of stability. Job losses were widespread over the month. Some were part of longer-term cutbacks--industrial machinery, electronic equipment, transportation equipment (mostly aircraft), and instruments. Other losses, such as those in apparel and food processing, followed unusually large increases in July. In all, 16 of the 20 individual industries within manufacturing had employment losses in August, as the factory job total reached its lowest point since April 1983.

Construction industry employment remained weak in August. After seasonal adjustment, the number of construction jobs was slightly lower than last winter, as losses in summer months offset gains in the spring.

Retail trade employment declined by 71,000 in August. Job losses continued in general merchandise stores, and an employment decrease in eating and drinking places reversed an increase in the prior month. Wholesale trade edged down by 8,000 in August; this industry has not shown an increase in over 2 years.

The services industry added 22,000 jobs over the month--well below the average monthly gain of 50,000 over the past year. Business services continued to grow at a relatively slow pace, after a more vigorous expansion during the spring months. Similarly, the August job gain in health services was slightly smoller than this industry's average so far in 1992. A small employment increase in finance, insurance, and real estate, on the other hand, offset some of the losses in prior months.

Weekly Hours (Establishment Survey Data)
The average workweek for private production or nonsupervisory workers increased 0.4 hour to 34.7 hours. There were no changes in the manufacturing workweek and factory overtime, which have held at 41.0 and 3.8 hours, respectively, throughout the summer. (See table B-2.)

The index of aggregate weekly hours of private production or nonsupervisory workers increased 0.8 percent to 121.8 (1982=100) in August, after seasonal adjustment, as the large increase in hours more than offset the employment decline. In contrast, the manufacturing index declined 0.7 percent to 101.9. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings rose by 0.7 percent in August and weekly earnings were up 1.8 percent, after seasonal adjustment. Prior to seasonal adjustment, average hourly earnings increased 4 cents to $\$ 10.56$ and average weekly earnings increased $\$ 5.61$ to $\$ 369.60$. Over the past year, average hourly and weekly earnings increased 2.6 and 3.5 percent, respectively. (See table B-3.)

The Employment Situation for September 1992 will be released on Friday, October 2, at 8:30 A.M. (EDT).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).
The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 350,000 establishments employing over 41 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th , which may or may not correspond directly to the calendar week.
The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below.

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid employees; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, labor-management disputes, or personal reasons.

People are classified as unemployed, regardless of their cligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; they were available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the number unemployed as a percent of the civilian labor force. Table A- 7 presents a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields $U-1$ and the most comprehensive yields U-7. The civilian worker unemployment rate is U-Sb, while U-5a, the overall unemployment rate, includes the resident Armed Forces in the labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonfarm firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, allhough based on a smaller sample, reflects a larger segment of the population; the establishment survey excludes agnculture the self-employed, unpaid fanily workers, and private household workers;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;
- The household survey is limited to those 16 years of age and older, the establishment survey is not limited by age;
- The houschold survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more uhan one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo shap fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.
Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To retum to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable
change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly eamings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the JulyDecember period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the $90-$ percent level of confidence-the confidence limits used by BLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 358,000 ; for total unemployment it is 224,000; and, for the civilian worker unemployment rate, it is 0.19 percentage points. These figures do not mean that the sample results are off by these magnitudes but, rather, that the chances
are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the error on monthly change in the jobless rate for men is .25 percentage point; for teenagers, it is 1.29 percentage points.

In the establishment survey, estimates for the most current 2 months are based on incomplete retums; for this reason, these estimates are labeled preliminary in the tables. When all the retums in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarkscomprehensive counts of employment-against which month-tomonth changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other Information

In order to provide a broad view of the nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 10.00$ per issue or $\$ 31.00$ per year from the U.S. Govemment Printing Office, Washington, DC 20204. A check or money order made out to the Superintendent of Documents must accompany all orders.
Employment and Earnings also provides approximations of the standard errors for the household survey data published in this release. For unemployment and other labor force categories, the standard errors appear in tables B through J of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables $M, O, P$, and $Q$ of that publication.
Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-606-STAT: TDD phone: 202-606-5897; TDD Message Referral Phone Number: 1-800-326-2577.

1 Unerpioyment as a percent of the civilian labor force.
2 Agoregate hours lost by the unemployed and persons on part time for economic reasons as a percent ol potentially avallable labor force hours
${ }^{3}$ Seasonally adjusted unemployment data for senvice occupations are not avalistle because the seasonal components are small relative to the trend-cycle andfor irregular components and consequently cannor be
teparated whh sufficiem preciston.
NOTE: Data on cccupations and Industries for 1992 are not fully comparable with data for prior years because of the introduction of the clasarication systerns used in the 1990 decennial census of population. Sorne categories, particularty "technical, sales, and adminitrative support," may have significant breaks in cortparablity.

${ }^{1}$ Data relate to production workers in mining and manulacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on privale nonfarm payrolls.

2 These series are not published seasonally adjusted sincee the seasonal component is small relajive to the trend-cycle and/or irregular components and consequenty carnot be separated with sufficient precision.
$P=$ preliminary.

Table B-4. Average hourly earnings of production or nonsupervisory workers ${ }^{1}$ on private nontarm payrolis by Industry, seasonally adjustad

|  |  |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Industry |  |  |  |  |  |  |  |

1 See footnote 1, table B-2.
2 The Consumer Price Index for Urtan Wage Earners and Clerical Workers (CPL-W) is used to deflate this sejies.

3 Change was -.3 percent from June 1992 to July

1992, the latest month available.
4 Derived by assuming that overtime hours are paid at the rate of time and one-half.
N.A. = not available.

P- preliminary.
