## THE EMPLOYMENT SITUATION: MARCH 1993

Employment and unemployment were little changed in March, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The unemployment rate remained at 7.0 percent. Payroll employment-as measured by the employer survey-held steady at 109.2 million. Total employment and the labor force-as measured by the household survey-were also little changed from February levels.

## Unemployment (Household Survey Data)

The number of unemployed persons, 8.9 million, was unchanged in March, after seasonal adjustment. The unemployment rate, also unchanged at 7.0 percent, remained 0.7 percentage point below its mid1992 high of 7.7 percent, but well above its prerecession level of slightly more than 5 percent. (See table A-1.)

Among worker groups, there was some improvement in unemployment for adult women, whose jobless rate fell for the second consecutive month, to 5.7 percent in March. The unemployment rate for adult men edged up slightly, to 6.7 percent. Jobless rates for teenagers ( 19.5 percent), whites ( 6.1 percent), blacks ( 13.5 percent), and Hispanics ( 11.4 percent) were about unchanged over the month, after seasonal adjustment. Rates for all of these worker groups have receded since peaking in mid-1992. (See tables A-1 and A-2.)

[^0]p=preliminary
${ }^{2}$ Data relate to private production or nonsupervisory workers.
N.A. = not available.

The number of persons employed part time for economic reasons fell by 267,000 in March, to 6.2 million, following a large February increase. The number of such workers, who are often referred to as the "partially unemployed," has fluctuated between 6.0 and 6.5 million for more than a year and a half. The March figure was about 1.4 million greater than in early 1990 , just prior to the onset of the recession. (See table A-3.)

## Total Employment and the Labor Force (Household Survey Data)

The total number of persons employed was about unchanged in March at 118.6 million, after seasonal adjustment. Since its most recent low in August 1991, total employment has grown by 2.0 million. The proportion of the population with jobs, 61.4 percent in March, held steady over the month, remaining about $1-1 / 2$ percentage points below prerecession levels. (See table A-1.)

At 127.4 million in March, the civilian labor force was about the same as in February. It has, in fact, shown little net growth since mid-1992. The labor force participation rate was 66.0 percent for the third consecutive month. (See table A-1.)

## Discouraged Workers (Household Survey Data)

The number of discouraged workers-those who would like to work but are not looking for jobs because they think their search would be in vain-was unchanged at 1.1 million in the first quarter of 1993. It has remained at about this level since the third quarter of 1991. (See table A-11.)

## Industry Payroll Employment (Establishment Survey Data)

The number of nonfarm payroll jobs was unchanged in March at 109.2 million, seasonally adjusted, following a sharp increase in the previous month. A further increase in services employment was offset by a decline in construction jobs. After showing little growth last summer, payroll employment has increased by 713,000 jobs since September. (See table B-1.)

Construction employment fell by 59,000 in March, after seasonal adjustment, following a large gain in February. Because of poor weather conditions over much of the country in late February and early March, there was a slowdown in the usual seasonal hiring activity. A slight gain in mining employment was due entirely to a return to work of striking coal miners.

The overall number of manufacturing jobs was about unchanged over the month at 18.1 million. While there were some small gains in the nondurable goods sector, employment declined in several durable goods industries, including those producing materials for construction and those dependent on defense purchases. Employment also was down among autc manufacturers and their suppliers.

Services employment rose by 60,000 in March. Continued strong growth in business services, especially in personnel supply, accounted for the bulk of the increase. Health services employment showed a modest gain; growth in this industry has slowed in the first quarter, primarily due to slack hiring in hospitals.

Retail trade employment, which had shown substantial growth in recent months, was unchanged at 19.4 million in March. Several retail trade industries, including eating and drinking establishments, showed modest gains, but these were offset by declines in other industries.

Employment in the remaining private sector industry groups was also about the same in March as in the previous month. Likewise, government employment was unchanged over the month. Over the past year, Federal employment has fallen by 67,000, while local government employment has risen by 195,000 .

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls edged down 0.1 hour in March to 34.3 hours, seasonally adjusted. Manufacturing hours fell 0.3 hour, to 41.2 hours. Factory overtime retreated from its all-time high in February, falling 0.4 hour to 3.9 hours. Severe winter storms in the survey reference period undoubtedly affected the March hours figures. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls decreased by 0.5 percent in March to $121.9(1982=100)$, after seasonal adjustment. The index for manufacturing, 102.6, fell by 0.8 percent. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers were up 0.5 percent in March, after seasonal adjustment, and average weekly earnings rose 0.2 percent. Prior to seasonal adjustment, average hourly earnings rose 3 cents to $\$ 10.81$, and average weekly earnings were little changed at $\$ 368.62$. Over the past year, average hourly earnings grew by 2.6 percent and average weekly earnings by 2.0 percent. (See table B-3.)

The Employment Situation for April 1993 will be released on Friday, May 7, at 8:30 A.M. (EDT).

## Planned Changes for the Current Population Survey (CPS)

Beginning in 1994, with the release of data for January, estimates from the Current Population Survey (household survey) will reflect the results of a major redesign of the survey. The redesign is being undertaken to obtain more accurate and comprehensive information on the labor force. As part of this effort, the survey questionnaire is being revamped to include many new and revised questions regarding individuals' employment and unemployment activities, and a fully automated data collection environment is being introduced.

Work on the redesign began in the late 1980s. The new questionnaire is being tested for an 18 -month period, July 1992-December 1993, in a separate national sample survey of about 13,000 households to gauge the effect of both the new questions and the automated data collection procedures on the labor force estimates. Early indications of the potential effects of these changes will not be available until this fall; a comprehensive examination will be published in the February 1994 issue of Employment and Earnings.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics Survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households that is conducted by the Bureau of the Census with most of the findings analyzed and published by the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes over 350,000 establishments employing over 41 million people.

For both surveys, the data for a given month are actually collected for and relate to a particular week. In the household survey, unless otherwise indicated, it is the calendar week that contains the 12 th day of the month, which is called the survey week. In the establishment survey, the reference week is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

The data in this release are affected by a number of technical factors, including definitions, survey differences, seasonal adjustments, and the inevitable variance in results between a survey of a sample and a census of the entire population. Each of these factors is explained below:

## Coverage, definitions, and differences between surveys

The sample households in the household survey are selected so as to reflect the entire civilian noninstitutional population 16 years of age and older. Each person in a household is classified as employed, unemployed, or not in the labor force. Those who hold more than one job are classified according to the job at which they worked the most hours.

People are classified as employed if they did any work at all as paid employees; worked in their own business or profession or on their own farm; or worked 15 hours or more in an enterprise operated by a member of their family, whether they were paid or not. People are also counted as employed if they were on unpaid leave because of illness, bad weather, labor-management disputes, or personal reasons.

People are classified as unemployed, regardless of their eligibility for unemployment benefits or public assistance, if they meet all of the following criteria: They had no employment during the survey week; theywere available for work at that time; and they made specific efforts to find employment sometime during the prior 4 weeks. Persons laid off from their former jobs and awaiting recall and those expecting to report to a job within 30 days need not be looking for work to be counted as unemployed.

The civilian labor force equals the sum of the number employed and the number unemployed. The unemployment rate is the number unemployed as a percent of the civilian labor force. Table A-7 presents
a special grouping of seven measures of unemployment based on varying definitions of unemployment and the labor force. The definitions are provided in the table. The most restrictive definition yields U-1 and the most comprehensive yields U-7. The civilian worker unemployment rate is $\mathrm{U}-5 \mathrm{~b}$, while $\mathrm{U}-5 \mathrm{a}$, the overall unemployment rate, includes the resident Armed Forces in the labor force base.

Unlike the household survey, the establishment survey only counts wage and salary employees whose names appear on the payroll records of nonfarm firms. As a result, there are many differences between the two surveys, among which are the following:

- The household survey, although based on a smaller sample, reflects a larger segmentofthe population; the establishment survey excludes agriculture, the self-employed, unpaid family workers, and private household workers;
- The household survey includes people on unpaid leave among the employed; the establishment survey does not;
- The household survey is limited to those 16 years of age and older, the establishment survey is not limited by age;
- The household survey has no duplication of individuals, because each individual is counted only once; in the establishment survey, employees working at more than one job or otherwise appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. For example, the labor force increases by a large number each June, when schools close and many young people enter the job market. The effect of such seasonal variation can be very large; over the course of a year, for example, seasonality may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events followa more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. To return to the school's-out example, the large number of people entering the labor force each June is likely to obscure any other changes that have taken place since May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable
change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Measures of labor force, employment, and unemployment contain components such as age and sex. Statistics for all employees, production workers, average weekly hours, and average hourly earnings include components based on the employer's industry. All these statistics can be seasonally adjusted either by adjusting the total or by adjusting each of the components and combining them. The second procedure usually yields more accurate information and is therefore followed by BLS. For example, the seasonally adjusted figure for the civilian labor force is the sum of eight seasonally adjusted employment components and four seasonally adjusted unemployment components; the total for unemployment is the sum of the four unemployment components; and the unemployment rate is derived by dividing the resulting estimate of total unemployment by the estimate of the civilian labor force.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Sampling variability

Statistics based on the household and establishment surveys are subject to sampling error, that is, the estimate of the number of people employed and the other estimates drawn from these surveys probably differ from the figures that would be obtained from a complete census, even if the same questionnaires and procedures were used. In the household survey, the amount of the differences can be expressed in terms of standard errors. The numerical value of a standard error depends upon the size of the sample, the results of the survey, and other factors. However, the numerical value is always such that the chances are approximately 68 out of 100 that an estimate based on the sample will differ by no more than the standard error from the results of a complete census. The chances are approximately 90 out of 100 that an estimate based on the sample will differ by no more than 1.6 times the standard error from the results of a complete census. At approximately the 90 -percent level of confidence-the confidence limits used by BLS in its analyses-the error for the monthly change in total employment is on the order of plus or minus 341,000 ; for total unemployment it is 251,000; and, for the civilian worker unemployment rate, it is 0.22 percentage points. These figures do not mean that the sample results
are off by these magnitudes but, rather, that the chances are approximately 90 out of 100 that the "true" level or rate would not be expected to differ from the estimates by more than these amounts.

Sampling errors for monthly surveys are reduced when the data are cumulated for several months, such as quarterly or annually. Also, as a general rule, the smaller the estimate, the larger the sampling error. Therefore, relatively speaking, the estimate of the size of the labor force is subject to less error than is the estimate of the number unemployed. And, among the unemployed, the sampling error for the jobless rate of adult men, for example, is much smaller than is the error for the jobless rate of teenagers. Specifically, the emror on monthly change in the jobless rate for men is .30 percentage point; for teenagers, it is 1.65 percentage points.

In the establishment survey, estimates for the most current 2 months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. When all the returns in the sample have been received, the estimates are revised. In other words, data for the month of September are published in preliminary form in October and November and in final form in December. To remove errors that build up over time, a comprehensive count of the employed is conducted each year. The results of this survey are used to establish new benchmarks-comprehensive counts of employment-against which month-to-month changes can be measured. The new benchmarks also incorporate changes in the classification of industries and allow for the formation of new establishments.

## Additional statistics and other information

In order to provide a broad view of the nation's employment situation, BLS regularly publishes a wide variety of data in this news release. More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 13.00$ per issue or $\$ 31.00$ peryear from the U.S. Government Printing Office, Washington, DC 20402. A check or money order made out to the Superintendent of Documents must accompany all orders.

Employment and Eamings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-H of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-F of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-606-STAT; TDD phone: 202-606-5897; TDD Message Referral Phone Number: 1-800-326-2577.

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-liths of the total employees on private nonfarm payrolls.

2 These series are not published seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.
$\mathrm{p}=$ preliminary.

1 Based on seasonally adjusted data for 1 -, 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span.
$P=$ preliminary.

NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

[^0]:    ${ }^{1}$ Includes other industries, not shown separately.

[^1]:    1 The population fligures are not adjusted for seasonal variation; therelore, dientical numbers appear in the unadjusted and seasonally
