## THE EMPLOYMENT SITUATION: MAY 1993

Employment rose in May and unemployment was about unchanged, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The unemployment rate, at 6.9 percent, was little different from the 7.0 -percent rates of the previous 3 months.

Payroll employment-as measured by the survey of establishments-rose by 209,000, after seasonal adjustment, with sizable gains in services and construction. Total employment-as estimated through the survey of households-showed an unusually large gain of 857,000 .

## Unemployment Household Suryey Datal

The number of persons who were unemployed in May ( 8.9 million) and the unemployment rate ( 6.9 percent) were little changed, not only from the prior month but also since the beginning of the year. Both series have, however, declined significantly from their peaks of last June.

The establishment data shown in this news release have been adjusted to reflect annual benchmark revisions, updated bias and seasonal adjustment factors, and corrections to historical data. See the note on the revisions beginning on page 5. Also, employment data for an additional 20 industries are published in table B-1 beginning with this release.

Table A. Major indicators of labor market activity, seasonally adjusted (Numbers in thousands)

[^0]'There was little or no change over the month in the unemployment rates for adult men ( 6.4 percent), adult women ( 5.9 percent), and teenagers ( 19.7 percent). Likewise, the rates for whites ( 6.0 percent) and Hispanics ( 9.7 percent) remained at or near their April levels. The jobless rate for blacks fell by nearly a full percentage point to 12.9 percent in May. The rate for black teenagers, which is quite volatile, dropped by 6.5 percentage points to 40.3 percent. (See tables A-1 and A-2.)

There were few changes in the pattern of unemployment by duration in May. Since the end of 1992, however, the number of persons who had been jobless for 15 weeks and over has declined, by 600,000 . Shorter term joblessness has shown little movement in this period. Accordingly, the median duration of unemployment has declined, from 9.4 weeks last December to 8.1 weeks in May. (See table A-5.)

## Total Employment and the Labor Force (Household Survey Data)

The estimated number of employed persons surged by 857,000 in May to 119.3 million, seasonally adjusted. Wide swings in the total employment numbers have frequently occurred, however, in the spring and early summer. Reflecting this unusually large over-the-month gain in employment, the proportion of the population with jobs-the employment-population ratio-rose to 61.7 percent in May, after showing little change since the beginning of the year. (See table A-1.)

The number of persons in the civilian labor force showed an increase of 790,000 in May, reaching 128.1 million, seasonally adjusted. The labor force participation rate rose to 66.3 percent. (See table A-1.)

## Industry Payroll Employment (Establishment Survey Data)

Nonfarm payroll employment increased by 209,000 in May, following a similar gain in April. (Payroll data have been revised; see the explanatory material on page 5.) May's increase raises the employment level to nearly 110.0 million, exceeding the June 1990 prerecession employment peak for the first time. While much of the growth was again concentrated in services, construction employment showed strength as well. Manufacturing employment, on the other hand, declined for the third straight month. (See table B-1.)

Construction added 67,000 jobs in May; the growth appears to have been spurred by better weather across the country, as well as continued low interest rates and pent-up demand for new homes. Since January, construction employment has risen by 130,000. Mining employment was unchanged in May.

The number of manufacturing jobs decreased by 39,000 in May, and the decline since February totaled 133,000. The durable goods portion of manufacturing lost nearly 50,000 jobs in May, offsetting minor gains in nondurable goods. As in the prior 2 months, much of the employment decline took place in transportation equipment ( 21,000 ), principally in automobile and aircraft manufacturing. Other notable areas of weakness within durables included fabricated metals, industrial machinery, electronic equipment, and instruments and related products, which together accounted for 23,000 of the lost jobs.

Within the service-producing sector, the services industry gained 126,000 jobs, following an even larger increase in April. Employment in services has increased by nearly 2 million since the recession ended in March 1991. Although much of the growth in May again occurred in business and health services, there were also gains in other service industries (which are shown in table B-1 for the first time).

Employment in retail trade edged up by 21,000 jobs in May, as continued losses in general merchandise stores were more than offset by gains elsewhere, particularly in eating and drinking places.

Retailers have added 440,000 jobs since December 1991, nearly returning employment to its prerecession peak. Wholesale trade employment increased in its nondurable goods distribution component. The transportation industry gained 11,000 jobs in May, mostly in trucking. Federal Government employment continued to edge downward, while state and local government employment continued to expand at a moderate pace.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls increased 0.4 hour in May to 34.8 hours, seasonally adjusted, its highest level since April 1989. The manufacturing workweek and overtime hours remained at the extraordinarily high levels of 41.5 and 4.2 hours, respectively. (See table B-2.)

The index of aggregate weekly hours of private production or nonsupervisory workers on nonfarm payrolls increased by 1.4 percent in May to 124.7 (1982=100), after seasonal adjustment. The index for manufacturing, however, declined by 0.2 percent, due to the employment loss. (See table B-5.)

## Hourly and Weekly Eamings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers increased by 0.6 percent in May to $\$ 10.83$, seasonally adjusted. Weekly earnings increased by 1.7 percent to $\$ 376.88$. Before seasonal adjustment, average hourly earnings rose 3 cents to $\$ 10.82$ and weekly earnings increased by $\$ 6.43$ to $\$ 375.45$. Over the year, hourly earnings increased by 2.8 percent and weekly earnings by 3.6 percent. (See table B-3.)

The Employment Situation for June 1993 will be released on Friday, July 2, at 8:30 A.M. (EDT).

## Planned Changes for the Household Survey Data

Beginning in 1994, with the release of data for January, estimates from the Current Population Survey (household survey) will reflect the results of a major redesign of the survey. The redesign is being undertaken to obtain more accurate and comprehensive information on the labor force. As part of this effort, the survey questionnaire is being revamped to include many new and revised questions regarding individuals' employment and unemployment activities, and a fully automated data collection environment is being introduced.

Work on the redesign began in the late 1980s. The new questionnaire is being tested for an 18 -month period, July 1992-December 1993, in a separate national sample survey of about 13,000 households to gauge the effect of both the new questions and the automated data collection procedures on the labor force estimates. Information as to the potential effects of these changes will be available in November; a comprehensive examination will be published in the February 1994 issue of Employment and Earnings.

## Revisions in the Establishment Survey Data

In accordance with annual practice, the establishment survey data have been revised to reflect comprehensive universe counts of payroll jobs (benchmarks). These counts are derived principally from unemployment insurance tax records for March 1992. The benchmark adjustment to March 1992 employment levels was $-59,000$, before seasonal adjustment, and $-36,000$, after seasonal adjustment. Table B presents revised total nonfarm employment data on a seasonally adjusted basis for the period April 1991 through February 1993. These revised data incorporate the effect of applying the rate of change measured by the sample to the new benchmark level, updated bias adjustments, and new seasonal adjustment factors. This process resulted in upward adjustments for the latter half of 1992 and early 1993; by February 1993, the previously published total nonfarm employment level was revised upward by 336,000.

In addition to the benchmark revisions described above, establishment survey employment series for April 1981 through February 1991 have been revised based on a lengthy analysis of the causes for the large benchmark revision of March 1991. These revisions adjust for the overcounts in the administrative data used to establish benchmark levels. The overstatement of employment is estimated to have accumulated to approximately 540,000 by the end of 1990 , with the majority of the problem developing over the latter half of the affected time period; adjustments have been tapered in accordingly. The historical corrections affect employment series, but not average weekly hours or average hourly earnings. Table C presents summary information on the effects of the corrections to previously published levels for the years 1981-91 and for all months, seasonally adjusted, from March 1990 to March 1991.

The June 1993 issue of Employment and Earnings will contain an article that discusses the effects of benchmark and post-benchmark revisions and the one-time historical corrections. This issue will also present revised seasonal adjustment factors to be used during May-October 1993 and revised estimates for all regularly published tables containing national establishment survey data on employment, hours, and earnings. All of the revised historical series will be published in a BLS bulletin which is expected to be issued in July. Five years of data for the "B" tables published in this release are available for purchase on diskette (call 202-606-6551); the full history for all establishment data series is available on magnetic tape (202-606-5957).

Further information on the revisions released today is contained in the document, "Payroll Survey Employment Estimates: March 1992 Benchmark Revisions and Historical Corrections," which is available upon request from the Bureau of Labor Statistics. Call 202-606-6555.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the $B$ tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with state agencies. In 1992, the sample included over 370,000 establistuments employing over 45 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12 th, which may or may not correspond directly to the calendar week.

## Coverage, definitlons, and differences between surveys

Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employmentpopulation ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, state, and local government entities. Employees on
nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goodsproducing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricuttural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes people on unpaid leave among the employed. The establishment survey does not.
- The houschold survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and
unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major age-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "rrue" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90 -percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90 -percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 341,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from $-241,000$ to 441,000 ( $100,000 \pm 341,000$ ). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90 percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90 -percent confidence interval would be greater than zero. In this case, it is likely (at least a 90 -percent chance) that an employment rise had, in fact, occurred. The 90 -percent confidence interval for the monthly change in unemployment is $\pm 251,000$, and for the monthly change in the unemployment rate it is $\pm .22$ percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated bynew firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly samplebased change. The size of the monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained fromadministrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from zero to 0.6 percent.

## Additional statistics and other Information

More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 13.00$ per issue or $\$ 31.00$ per year from the U.S. Govermment Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-H of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-G of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-606-STAT; TDD phone: 202-606-5897; TDD message referral phone: 1-800-326-2577.

1 These are the official Bureau of Labor Statistics' estimates used in the administration of Federal fund allocation programs.
${ }_{2}$ The population figures are not adjusted for seasonal variation; therefore,
identical numbers appear in the unadjusted and the seasonally adjusted columns.

1 Based on seasonaly adjusted data for 1 -. 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span.
$p=$ pretiminary.
NOTE: Figures are the percent of industries with employment
increasing plus one-half of the industries with unchanged employment. where 50 percent indicates an equal balance between industries with increasing and decreasing employment. Data have been revised to reflect March 1992 benchmarks, updated seasonal adjustment lactors, and corrections to historical series.

[^0]:    ${ }^{1}$ Establishment data have been revised to reflect March $1992{ }^{3}$ Data relate to private production or nonsupervisory workern. benchmarks and updated seasonal adjustment factors. N.A. = not available.
    ${ }^{2}$ Includes other industries, not shown separately. $\quad \mathbf{p}=$ preliminary.

[^1]:    ${ }^{1}$ Excludes perions "with a job but not af worke during the surver period for auch reasons as vacailon, Ilnees, of industriad diepute.

[^2]:    N.A. = not avallable.

[^3]:    1 Includes other industries, not shown separately.
    = preliminary.

[^4]:    ${ }^{1}$ Data relate to production workers in mining and manulacturing: construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fiths of the total employees on private nonfarm payrolls.
    2 These series are not published seasonally adjusted since the
