THE EMPLOYMENT SITUATION: JUNE 1993

Both employment and unemployment were essentially unchanged in June, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The unemployment rate was 7.0 percent, the level that has essentially prevailed thus far in 1993.

Employment, as measured by both the household and payroll surveys, was little changed in June, following substantial gains in May. Payroll jobs in manufacturing declined by 53,000 over the month.

<u>Unemployment (Household Survey Data)</u>

The unemployment rate (7.0 percent) and the number of persons unemployed (8.9 million) were about unchanged in June, after seasonal adjustment. Both measures have shown very little movement since the beginning of 1993. Jobless rates for adult men (6.5 percent), adult women (5.9 percent), teenagers (19.8 percent), whites (6.1 percent), blacks (13.3 percent), and Hispanics (10.2 percent) were all at or close to their May levels. (See tables A-1 and A-2.)

Total Employment and the Labor Force (Household Survey Data)

The number of employed persons was virtually unchanged in June at 119.2 million, after a very large increase in the prior month. The employment-population ratio—the proportion of the

N.A. = not available.

p = preliminary.

² Data relate to private production or nonsupervisory workers.

working-age population with jobs—was 61.6 percent, just slightly above its June 1992 level of 61.4 percent. (See table A-1.)

The number of voluntary part-time workers showed an increase of 578,000 to 15.6 million in June, while the number working part time for economic reasons edged down by 258,000 to a level of 6.3 million. These series, however, tend to exhibit considerable month-to-month variability. (See table A-3.)

At 128.1 million persons, the civilian labor force was unchanged in June, following a surge in May. The labor force participation rate was 66.2 percent, three-tenths of a percentage point below the year-earlier rate. (See table A-1.)

Discouraged Workers (Household Survey Data)

The number of discourage I workers—persons who want to work but are not looking because they believe they cannot find a job—was 1.2 million in the second quarter of 1993. There has been very little change in the number of discouraged workers since the third quarter of 1991. (See table A-11.)

Industry Payroll Employment (Establishment Survey Data)

The number of nonfarm payroll jobs was unchanged in June at 110.0 million, seasonally adjusted, following large increases in several recent months. Over-the-month employment gains in services and retail trade were offset by a further decline in factory jobs and smaller losses elsewhere. (See table B-1.)

Manufacturing employment declined by 53,000 in June; job losses in this industry have totaled 187,000 since February. Although June losses were widespread, they were particularly evident in durable goods, such as transportation equipment (mostly aircraft), electronic equipment, and instruments. These losses partially reflected cutbacks in defense spending. Within nondurables, the largest job losses occurred in the food and apparel industries. Since factory employment last peaked in January 1989, about 1.7 million jobs have been lost.

Employment in the services industry grew by 56,000 in June and has risen by 1.2 million over the past year. The June gain primarily reflected growth in business, health, and educational services.

Retail trade employment was up by 37,000 from May, with most of the growth occurring in eating and drinking places. Employment in general merchandise stores, on the other hand, showed another decline in June, for a total loss of 72,000 jobs over the past year.

Wholesale trade lost 11,000 jobs in June, following steady gains for the prior 8 months. Most of the June losses occurred in nondurable goods distribution, reversing the May increase.

Employment in construction was little changed in June, following strong gains in the prior 2 months. Mining employment was down, primarily as the result of a coal strike.

Federal government employment continued to edge down. Led by cutbacks in the Postal Service and defense agencies, federal employment has shrunk by 83,000 since peaking in March of last year. Local and state governments continued their moderate employment gains in June.

Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls fell by 0.3 hour to 34.4 hours in June, seasonally adjusted, reversing an increase of the same magnitude in May. Both the average factory workweek and its overtime component edged down 0.1 hour for the second straight month, to 41.3 and 4.0 hours, respectively. (See table B-2.)

The index of aggregate weekly hours of private production or nonsupervisory workers on nonfarm payrolls fell by 1.0 percent to 123.4 (1982=100) in June, seasonally adjusted. The manufacturing index declined 0.6 percent to 100.8, following a decline of 0.4 percent the previous month; these reductions reflect decreases in both employment and the workweek. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers edged down 0.1 percent in June, seasonally adjusted. Average weekly earnings declined by 1.0 percent, following a substantial increase in May. Before seasonal adjustment, average hourly earnings declined by 5 cents to \$10.75, and average weekly earnings were down by \$2.81 to \$371.95. Over the past year, average hourly earnings increased by 2.2 percent and average weekly earnings by 2.5 percent. (See table B-3.)

The Employment Situation for July 1993 will be released on Friday, August 6, at 8:30 A.M. (EDT).

Planned Changes for the Household Survey Data

Beginning in 1994, with the release of data for January, estimates from the Current Population Survey (household survey) will reflect the results of a major redesign of the survey. The redesign is being undertaken to obtain more accurate and comprehensive information on the labor force. As part of this effort, the survey questionnaire is being revamped to include many new and revised questions regarding individuals' employment and unemployment activities, and a fully automated data collection environment is being introduced.

Work on the redesign began in the late 1980s. The new questionnaire is being tested for an 18-month period, July 1992-December 1993, in a separate national sample survey of about 13,000 households to gauge the effect of both the new questions and the automated data collection procedures on the labor force estimates. Information as to the potential effects of these changes will be available in November, a comprehensive examination will be published in the February 1994 issue of Employment and Earnings.

Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with state agencies. In 1992, the sample included over 370,000 establishments employing over 45 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys

Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as *employed* if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4-week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, state, and local government entities. *Employees on*

nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes people on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers 16 years of age and older.
 The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and

unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major age-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 341,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90-percent confidence interval on the monthly change would range from -241,000 to 441,000 $(100,000 \pm 341,000)$. These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90-percent chance) that an employment rise had, in fact, occurred. The 90-percent confidence interval for the monthly change in unemployment is ±251,000, and for the monthly change in the unemployment rate it is \pm .22 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly sample-based change. The size of the monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from zero to 0.6 percent.

Additional statistics and other information

More comprehensive statistics are contained in *Employment and Earnings*, published each month by BLS. It is available for \$13.00 per issue or \$31.00 per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-H of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-G of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-606-STAT; TDD phone: 202-606-5897; TDD message referral phone: 1-800-326-2577.

These are the official Bureau of Labor Statistics' estimates used in the administration of Federal fund allocation programs.
The population figures are not adjusted for seasonal variation; therefore,

identical numbers appear in the unadjusted and the seasonally adjusted columns.

¹ Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonfarm

² These series are not published seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.

P = preliminary.

p = preliminary.

See footnote 1, table B-2.
 The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) is used to deflate this

series.
Change was .3 percent from April 1993 to May 1993,

the latest month available.

4 Derived by assuming that overtime hours are paid at the rate of time and one-half.

N.A. = not available.

P = preliminary.
