## THE EMPLOYMENT SITUATION: JANUARY 1995

Unemployment rose in January and nonfarm payroll job growth slowed, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. After declining markedly during 1994, the nation's jobless rate rose by 0.3 percentage point to 5.7 percent.

The number of nonfarm payroll jobs (as measured by the survey of employers) increased by 134,000 in January, after having risen by nearly 750,000 in the prior 2 months. Total employment (as measured by the survey of households) was little changed over the month.

## Unemployment (Household Survey Data)

The number of unemployed persons increased by 343,000 to 7.5 million in January, and the unemployment rate rose by 0.3 percentage point to 5.7 percent, after seasonal adjustment. Unemployment had been on a downward trend in 1994; the level had declined by 1.6 million, and the jobless rate had fallen by 1.3 percentage points, from 6.7 percent in January to 5.4 percent in December. (See table A-1.)

Among the major worker groups, adult men accounted for much of the January increase in unemployment; their jobless rate was up by 0.3 percentage point over the month to 5.0 percent. The rate

[^0]$p=$ preliminary.
for adult women ( 4.9 percent) rose slightly, while that for teenagers ( 16.7 percent) was little changed from the prior month. The rate for Hispanics rose to 10.2 percent in January, equaling that for blacks for the first time (Hispanic data first became available in 1973). The rate for whites, at 4.9 percent, changed little from the December figure. (See tables A-1 and A-2.)

The rise in joblessness reflected primarily an increase in the number of newly unemployed persons (less than 5 weeks duration). Their number rose by 350,000 over the month to 2.9 million. There also was an increase in the number of unemployed persons on temporary layoff-those expecting to be recalled to their jobs. At 1.1 million in January, the number of such workers was up by 131,000 from the prior month. (See tables A-5 and A-6.)

The number of persons working part time for economic reasons-sometimes referred to as the partially unemployed-increased by 271,000 over the month to 4.7 million. (See table A-3.)

## Total Employment and the Labor Force (Household Survey Data)

The number of employed persons was about unchanged over the month, at 124.6 million (seasonally adjusted). That measure had increased substantially during the last half of 1994. The employmentpopulation ratio-the proportion of the working-age population with jobs-was 63.0 percent for the third consecutive month. (See table A-1.) A total of 7.2 million workers (not seasonally adjusted), or 5.8 percent of all employed persons, held two or more jobs in January (table A-8).

At 132.1 million, the number of persons in the labor force rose by 411,000 over the month. The labor force participation rate was up by 0.2 percentage point to 66.8 percent. Compared with a year ago, re labor force has risen by 1.5 million. (See table A-1.)

## Persons Not in the Labor Force (Household Survey Data)

The number of persons with a marginal attachment to the labor force-those who wanted and were available for work, but were no longer actively looking for jobs after having searched sometime in the past 12 months-was 1.8 million (not seasonally adjusted) in January. Of that number, those who were not looking because they believed their prospects for finding jobs were poor-discouraged workerstotaled 440,000. (See table A-8.)

## Industry Payroll Employment (Establishment Survey Data)

Total nonfarm payroll employment rose by 134,000 in January, seasonally adjusted, following generally larger gains throughout 1994. Manufacturing continued to add jobs at a brisk pace, but job growth in services and retail trade was considerably slower than in recent months. (See table B-1.)

Manufacturing employment continued its upward trend in January with a seasonally adjusted increase of 39,000 . Gains were concentrated in motor vehicles, fabricated metals, industrial machinery, and rubber and plastics. These industries, along with electronic equipment, have accounted for the bulk of the manufacturing job growth in the past several months. The large increase in automobile jobs $(16,000)$ reflected continued production in factories that typically shut down at the beginning of the year to adjust inventories. Employment growth of 27,000 in the construction industry in January was boosted ${ }^{4} v$ relatively mild temperatures across the nation.

Services employment increased by 53,000 in January, the smallest monthly gain in nearly 2 years. Business services had its smallest rise since last spring, despite another gain in its personnel supply component. Health services, where growth has been limited by the drive for cost containment, also had relatively weak growth for the month. Weather-related job declines occurred in amusement and recreation services, where the lack of snow affected the ski industry, and in agricultural services, which suffered from the flooding in California. On the positive side, there was continued strength in social services, engineering and management services, auto repair, and motion pictures.

Retail trade employment was virtually unchanged in January, following substantial gains in the prior 4 months. Sizable declines in general merchandise stores and eating and drinking places in January partially countered large increases experienced by these industries at the end of 1994. Jobs in the transportation and public utilities industry rose by 15,000 in January, as growth continued in trucking and warehousing. Wholesale trade employment increased by 16,000 , continuing its pace of job growth set over the past year. In contrast, government employment decreased by 32,000 over the month. Most of this drop was in Federal employment, reflecting continued downsizing, as well as the dismissal of a large number of workers from the Postal Service who had been hired for the holiday season.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls increased by 0.3 hour in January to 34.9 hours, seasonally adjusted. The workweek for manufacturing workers was unchanged over the month at 42.2 hours, while factory overtime edged up 0.1 hour to a new high of 4.9 hours. The index of aggregate weekly hours of private production or nonsupervisory workers on nonfarm payrolls increased 1.0 percent to $132.3(1982=100)$. The manufacturing index rose by 0.3 percent to 107.5 , as a result of the increase in employment. (See tables B-2 and B-5.)

## Hourly and Weekly Eamings (Establishment Survey Data)

Average hourly earnings of private production or nonsupervisory workers rose 7 cents in January to $\$ 11.32$, seasonally adjusted. Similar large increases last January and again in October were followed by 2 months of no (net) change. Average weekly earnings in January climbed 1.5 percent to $\$ 395.07$. Over the year, hourly earnings rose by 2.7 percent and weekly earnings by 3.0 percent. (See table B-3.)

The Employment Situation for February 1995 will be released on Friday, March 10, at 8:30 A.M. (EST).

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the $B$ tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. In March 1993, the sample included over 390,000 establishments employing over 47 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12 th day of the month. In the establishment survey, the reference period is the pay period including the 12 th, which may or may not correspond directly to the calendar week

## Coverage, definitions, and differences between surveys

Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labar force participation rate is the labor force as a percent of the population, and the employmentpopulation ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local govermment entities. Employees on
nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings dats are for private businesses and relate only to production workers in the goodsproducing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricultural workers, the self-mployed, unpaid famity workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes peopie on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because undividuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal ductuations may account for as much as 95 percent of the month-tomonth changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youthentering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjustad series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and unemployment are computed by aggregating independently adjusted
component series. For example, total unemployment is derived by summing the adjusted series for four major age-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90 -percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 359,000 . Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from $-259,000$ to 459,000 $(100,000+/-359,000)$. These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a $90-$ percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90 -percent confidence interval would be greater than zero. In this case, it is likely (at least a 90 -percent chance) that an employment rise had, in fact, occurred. The 90 -percent confidence interval for the monthly change in unemployment is $+/-256,000$, and for the monthly change in the unemployment rate it is +/-. 22 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly samplebased change. The size of the monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from zero to 0.6 percent.

## Additional statistics and other information

More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 14.00$ per issue or $\$ 29.00$ per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-H of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-G of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-606-STAT; TDD phone: 202-606-5897; TDD message referral phone: 1-800-326-2577.

1 Unemployment as a percent of the civilian labor force.
2 Seasonally adjusted unemployment data for service occupations are not available because the seasonal components are small relative to the trend-cycle
and/or irregular components and consequently cannot be separaled with sufficient precision.

1 These are the official Bureau of Labor Statistics' estimates used in the administration of Federal fund allocation programs.

2 The population figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and the seasonally adjusted

## columns.

NOTE: Data have been revised to incorporate updated 1990 census-based population controls and new seasonal adjustment factors. Data for 1990-94 are subject to revision.

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fiths of the total employees on private nonfarm payrolls.

2 These series are not published seasonally adjusted since the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.
$\mathbf{P}=$ preliminary.

[^4]NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

[^0]:    ' Includes other industries, not shown separately.
    ${ }^{2}$ Data relate to private production or nonsupervisory workers.

[^1]:    ${ }^{1}$ Data reter to persons who have searched for work during the prior 12 months and were available to take a job during the reference week.
    2 Includes thinks no work available, could not find work, lacks schooling or training, employer thinks too young or old, and other types of discrimination.
    aning, emplayer thinks too young or old, and other types of discrimination.
    3 Includes those who did not actively look for work in the prior 4 weeks for

[^2]:    1 See footnote 1, table B-2.
    2 The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) is used to dellate this segुes.

    Change was .0 percent from November 1994 to

[^3]:    December 1994, the lalest month availiable.
    4 Derived by assuming that overtime hours are paid at the rate of time and one-halt.

[^4]:    ${ }^{1}$ Based on seasonaily adjusted data for 1 -, 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span.
    $p=$ preliminary.
