THE EMPLOYMENT SITUATION: OCTOBER 1998

Payroll employment grew modestly, and the unemployment rate was unchanged at 4.6 percent in October, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The number of payroll jobs was up by 116,000, following a rise of 157,000 in September (as revised). Growth in services and most other industries in October was partly offset by a large decline in manufacturing. The increase in average hourly earnings was small for the second month in a row.

Unemployment (Household Survey Data)
The number of unemployed persons, 6.3 million in October, was unchanged over the month. The unemployment rate remained at 4.6 percent; it has been at or below 5.0 percent since April 1997. Among the major worker groups, the jobless rates for adult men ( 3.7 percent), adult women ( 4.0 percent), teenagers (16.0 percent), whites (4.0 percent), blacks (8.6 percent), and Hispanics ( 7.2 percent) showed little or no change in October. (See tables A-1 and A-2.)

Among the major educational attainment categories, the unemployment rate for college graduates 25 years and older rose to 2.0 percent, about the same as earlier this year. Jobless rates for persons with less than a high school diploma ( 6.8 percent), high school graduates with no college (4.0 percent), and persons with some college experience but no bachelor's degree (3.0 percent) showed little or no change over the month. (See table A-3.)

The number of persons unemployed for less than 5 weeks increased by 218,000 to 2.9 million in October. The number of unemployed who were new entrants--persons who were looking for their first jobs--increased by 102,000. (See tables A-6 and A-7.)

Total Employment and the Labor Force (Household Survey Data)
Total employment was essentially unchanged over the month at 131.7 million, after seasonal adjustment. The employment-population ratio--the proportion of the population age 16 and older with jobs--was 63.9 percent, little changed from the previous month. (See table A-1.)

About 8.2 million persons (not seasonally adjusted) held more than one job in October. These multiple jobholders comprised 6.2 percent of total employment, the same proportion as a year earlier. (See table A-10.)

The civilian labor force also was about unchanged in October, at 138.0 million, seasonally adjusted. Over the year, the labor force has grown by 1.9 million, after adjusting for the changes in the composite estimation

Table A. Major indicators of labor market activity, seasonally adjusted (Numbers in thousands)

procedure introduced with the January 1998 data. In October, the labor force participation rate was 67.0 percent, about unchanged from the prior year. (See table A-1.)

Persons Not in the Labor Force (Household Survey Data)
About 1.2 million persons (not seasonally adjusted) were marginally attached to the labor force in October. These were people who wanted and were available for work and had looked for a job sometime in the prior 12 months but were not counted as unemployed because they had not searched for work in the 4 weeks preceding the survey.

The number of discouraged workers--a subset of the marginally attached who were not currently looking for work specifically because they believed no jobs were available for them--was 333,000 in October, about the same as a year earlier. (See table A-10.)

## Industry Payroll Employment (Establishment Survey Data)

Nonfarm payroll employment rose by 116,000 in October to 126.5 million, seasonally adjusted. Employment in manufacturing fell sharply, while the number of jobs in construction and in several service-producing industries grew. Employment growth has slowed in recent months, with gains averaging about 148,000 a month since July, compared with 247,000 during the first 7 months of the year (after adjustment for the effects of the strikes in automobile-related manufacturing).

Manufacturing employment decreased by 52,000 in October; since March it has fallen by 198,000. Over-the-month losses were widespread throughout the industry. The largest declines were in apparel ( $-14,000$ ) and in electronic equipment $(-12,000)$. Each of these industries has lost nearly 50,000 jobs since March. Employment declines also occurred in October in primary metals, industrial machinery, instruments, and miscellaneous manufacturing. Motor vehicles added 7,000 jobs; auto inventories were still low, following the recent strikes and related plant shutdowns.

Construction employment increased by 19,000 in October, following a loss of similar magnitude in September. Gains occurred in general building and special trade contractors. Mining continued its long-term downward trend, shedding 5,000 jobs in October. Since September 1997, employment in the industry has declined by 29,000.

In the service-producing sector, the services industry added 95,000 jobs in October, more than in either of the prior 2 months, but still less than the average for the first 7 months of 1998 (117,000). Employment in business services rose by 58,000, following a decline in September. Within business services, employment in personnel supply was up by 21,000 over the month but remained below its June peak. Gains in computer services and in engineering and management services continued in October, with each industry adding 13,000 jobs. Since July, however, the pace of growth has slackened in both industries. Health services employment rose by 12,000 in October, as continued losses in home health care services partially offset increases in hospitals and offices and clinics of medical doctors. Over-the-month employment declines occurred in amusement and recreation services ( $-17,000$ ) and hotels and other lodging places ( $-12,000$ ); however, these industries had experienced strong hiring during much of the year.

Employment in finance rose by 18,000 in October, following no growth in the prior month. Employment in commercial banks increased by 3,000, the
first gain since March. Mortgage brokerages had an especially large job gain ( 7,000 ), and security brokerages continued their growth trend, adding 4,000 jobs. Employment in real estate was little changed in October and has shown no net growth since July.

Transportation employment grew by 13,000 in October, with much of the increase occurring in trucking (8,000). Returning strikers accounted for most of the 8,000 increase in employment in the communications industry.

Employment in retail trade edged down in October, following a large increase in September. In general merchandise stores, employment declined by 28,000 in October, following a similar increase in the prior month. Apparel and accessory stores had an employment loss of 13,000 in October. Other retail industries showed employment gains, with the largest occurring in auto dealers and service stations (11,000). Employment in wholesale trade was little changed in October, following a substantial increase in September.

Government employment increased by 24,000 over the month, with most of the gain taking place in federal government. The large increase in federal government (18,000) resulted from the hiring of workers in preparation for the decennial census.

Weekly Hours (Establishment Survey Data)
The average workweek for production or nonsupervisory workers on private nonfarm payrolls increased by 0.2 hour in October to 34.6 hours, seasonally adjusted, returning to its August level. The manufacturing workweek also increased by 0.2 hour to 41.8 hours, while factory overtime was unchanged at 4.5 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls rose by 0.6 percent to 145.6 (1982=100), seasonally adjusted. The manufacturing index increased by 0.2 percent in October to 108.0, reflecting the increase in the factory workweek. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls edged up 1 cent in October to \$12.88, seasonally adjusted. Average weekly earnings increased by 0.7 percent in October to $\$ 445.65$. Over the year, both average hourly and weekly earnings have risen by 3.6 percent. (See table B-3.)

The Employment Situation for November 1998 is scheduled to be released on Friday, December 4, at 8:30 A.M. (EST).

## Changes in Establishment-based Data Series

Following usual practice, the 6 -month updates to seasonal |adjustment factors for the establishment survey data will be |introduced with next month's release of November data. These |factors will be used for the September 1998 through April 1999 |estimates and will be published in the December 1998 issue of |Employment and Earnings. As a service to users, these factors |will be available about 1 week prior to the release of November| |estimates on the Internet (http://stats.bls.gov/ceshome.htm) or |by calling (202) 606-6521.

## Explanatory Note

This news release presents statistics from two major surveys, the current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 50,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the $B$ tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. In June 1998, the sample included about 390, 000 establishments employing about 48 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys
Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local government entities. Employees on nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:
--The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
--The household survey includes people on unpaid leave among the employed. The establishment survey does not.
--The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
--The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major agesex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December
period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a $90-\mathrm{percent}$ chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90 -percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 376,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from -276,000 to 476,000 (100,000 376,000). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a $90-$ percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a $90-$ percent chance) that an employment rise had, in fact, occurred. The 90 -percent confidence interval for the monthly change in unemployment is 258,000, and for the monthly change in the unemployment rate it is .21 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly sample-based change. The size of the
monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from zero to 0.6 percent.

Additional statistics and other information
More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 17.00$ per issue or $\$ 35.00$ per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-H of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-G of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-606-STAT; TDD phone: 202-606-5897; TDD message referral phone: 1-800-326-2577.

1 The population figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.

NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups. Beginning in January 1998, data reflect new composite estimation procedures and revised population controls used in the household survey.

Table A-3. Employment status of the civilian population 25 years and over by educational attainment, seasonally adjusted
(Numbers in thousands)

1 The population figures are not adjusted for seasonal variation, therefore, identical numbers appear in the unadjusted and seasonally adjusted columns.

2 Includes high school diploma or equivalent.
Includes the categories, some college, no degree; and associate degree.
NOTE: Beginning in January 1998, data reflect new composite estimation procedures and revised population controls used in the household survey.

1 Unemployment as a percent of the civilian labor force.
2 Seasonally adjusted unemployment data for service occupations are not available because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.

NOTE: Beginning in January 1998, data reflect new composite estimation procedures and revised population controls used in the household survey.

| U-6 Total unemployed, plus all marginally attached workers, plus total employed <br> part time for economic reasons, as a percent of the civilian labor force plus |  | 5.3 | 5.1 | (1) | (1) | (1) | (1) | (1) | (1) |
| all marginally attached workers........................ |  | 7.61 | 7.31 | (1) | (1) | (1) | (1) | (1) | (1) |

1 Not available.
NOTE: This range of alternative measures of labor underutilization replaces the U1-U7 range published in table A-7 of this release prior to 1994. Marginally attached workers are persons who currently are neither working nor looking for work workers, a subset of the marginally attached, have given a job-market related reason for not currently looking for a job. Persons employed part time for economic reasons are those who want and are available for full-time work but have had to settle for a part-time schedule. For further information, see "BLS introduces new range of alternative unemployment measures," in the October 1995 issue of the Monthly Labor Review. Beginning in January 1998, data reflect new composite estimation procedures and revised population controls used in the household survey.

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonfarm payrolls.
2 These series are not published seasonally adjusted because the seasonal component, which is small relative to the rend-cycle and irregular components, cannot be separated with sufficient precision.
$\mathrm{p}=$ preliminary.

Table B-3. Average hourly and weekly earnings of production or nonsupervisory workers1 on private nonfarm payrolls by industry

1 Based on seasonally adjusted data for 1-, 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span.
= preliminary
位: figures are the percent of industries with employment increasing plus one-half of the industries with employment.

[^0]:    1 Data refer to persons who have searched for work during the prior 12 months and were available to take a job during the
    reference week.
    2 Includes thinks no work available, could not find work, lacks schooling or training, employer thinks too young or old, and other types of discrimination.
    3 Includes those who did not actively look for work in the prior 4 weeks for such reasons as child-care and transportation problems, as well as a small number for which reason for nonparticipation was not determined.

    4 Includes persons who work part time on their primary job and full time on their secondary job(s), not shown separately. NOTE: Beginning in January 1998, data reflect new composite estimation procedures and revised population controls used in the household survey.
