THE EMPLOYMENT SITUATION: MAY 2001

Nonfarm employment and the unemployment rate were little changed in May, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Manufacturing had another large job loss, which was mostly offset by employment gains in other industries, including services, construction, and finance, insurance, and real estate.

Unemployment (Household Survey Data)
Both the number of unemployed persons ( 6.2 million) and the unemployment rate ( 4.4 percent) were little changed in May. The unemployment rate was half a percentage point higher than its recent low of 3.9 percent in October. The rates for all the major worker groups--adult men (3.9 percent), adult women ( 3.8 percent), teenagers ( 13.6 percent), whites (3.8 percent), blacks ( 8.0 percent), and Hispanics ( 6.2 percent)--showed little or no change over the month. (See tables A-1 and A-2.)

Total Employment and the Labor Force (Household Survey Data)
Total employment (135.1 million) edged down in May after seasonal adjustment. The employment-population ratio decreased to 63.9 percent and has fallen by 0.6 percentage point since January. The civilian labor force dropped by 485,000 over the month to 141.3 million, seasonally adjusted, and the labor force participation rate--the proportion of the population 16 years of age and older who are either working or looking for work--fell to 66.8 percent. (See table A-1.)

In May, 7.5 million persons (not seasonally adjusted) held more than one job. These multiple jobholders represented 5.5 percent of the employed, down from 5.7 percent 1 year earlier. (See table A-10.)

The establishment data in this release have been revised as a| result of the annual benchmarking process; the introduction of probability-based sample estimates for mining, construction, and| manufacturing; and the updating of seasonal adjustment factors. More information on the revisions is contained in the note beginning on page 5 .

1/ Establishment data have been revised to reflect March 2000 benchmarks, the introduction of probability-based sample estimates for mining, construction, and manufacturing; and recomputed seasonal adjustment factors.

2/ Includes other industries, not shown separately.
3/ Data relate to private production or nonsupervisory workers.
$\mathrm{p}=$ preliminary .

## Persons Not in the Labor Force (Household Survey Data)

About 1.1 million persons (not seasonally adjusted) were marginally attached to the labor force in May, the same as a year earlier. These were people who wanted and were available for work and had looked for a job sometime in the prior 12 months but were not counted as unemployed because they had not searched for work in the 4 weeks preceding the survey. In May, the number of discouraged workers was 325,000. Discouraged workers, a subset of the marginally attached, were not currently looking for work specifically because they believed no jobs were available for them. (See table A-10.)

Industry Payroll Employment (Establishment Survey Data)
Nonfarm payroll employment was little changed in May at 132.5 million, seasonally adjusted. This follows a decline of 182,000 (as revised) in April. In May, manufacturing employment again fell sharply, and there were continued job losses in wholesale trade. At the same time, several other industries added jobs, including services, construction, and finance, insurance, and real estate. (See table B-1.)

Manufacturing employment dropped by 124,000 in May. Since last July, job losses in manufacturing have totaled 675,000, with more than two-thirds of the decline occurring since December. Declines in manufacturing were widespread in May. The largest were in electronic equipment (26,000), industrial machinery $(18,000)$, motor vehicles $(15,000)$, and fabricated metals (15,000). Since December, employment in these four industries has fallen by 248,000, a little over half of the total loss for manufacturing this year.

Construction employment increased by 31,000 in May, after seasonal adjustment, partially offsetting a decline of 78,000 in April. The average monthly job gain in construction so far this year $(18,000)$ has been the same as the average for all of 2000.

Mining employment grew by 4,000 in May. Oil and gas extraction continued on the upward trend that began in the fall of 1999; so far this year, the industry has added 19,000 jobs and has accounted for all of the growth in mining.

In the service-producing sector, employment in finance, insurance, and real estate rose by 22,000 in May. Following losses in the first half of 2000, this industry has added 112,000 jobs since July. Over the month, employment rose in nearly all the component industries. Mortgage banks and brokerages continued to add jobs. Following 2 years of sustained job losses, employment in commercial banks has risen for 3 consecutive months. In contrast, employment in security brokerages has weakened in recent months; the industry lost 3,000 jobs in May.

Services employment rose by only 42,000 in May, following a loss of 78,000 in April. Gains in educational services ( 26,000 ), health services $(23,000)$, social services $(14,000)$, and agricultural services $(13,000)$ were largely offset by losses in business services $(34,000)$ and motion pictures (22,000). Within business services, employment in help supply services was virtually unchanged in May. This follows a sharp downward trend from October through April that lowered help supply employment by 346,000. In May, job growth continued to slow in computer services, and engineering and management services showed a small employment loss.

Retail trade employment was little changed in May, following a large increase in April. Monthly employment gains in this industry so far this year have averaged 21,000, slightly below the monthly average for all of 2000. In May, employment increased in building material stores, general merchandise stores, and auto dealerships, while declines took place in furniture, apparel, and food stores.

Employment in transportation and public utilities rose by 12,000 in May, offsetting a decline in April. Growth in this industry has been sluggish so far this year, with monthly job increases averaging 5,000, compared with 14,000 in 2000. In government, there was a small employment gain in local education.

Wholesale trade employment continued on the downward trend that started late last year. Declines in April (12,000) and May (14,000) were particularly large. Most of the weakness in this industry has been in the distribution of durable goods.

Weekly Hours (Establishment Survey Data)
The average workweek for production or nonsupervisory workers on private nonfarm payrolls edged up by 0.1 hour in May to 34.3 hours, seasonally adjusted. The manufacturing workweek declined by 0.2 hour to 40.8 hours. Manufacturing overtime was unchanged at 3.9 hours. Over the past 12 months, the factory workweek has fallen by 0.8 hour and factory overtime by 0.7 hour. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls was unchanged at 151.5 (1982=100), seasonally adjusted, and was virtually the same as a year earlier. The manufacturing index fell by 1.5 percent in May to 99.1. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls increased by 4 cents in May to $\$ 14.26$, seasonally adjusted. Over the month, average weekly earnings increased by 0.6 percent to $\$ 489.12$. Over the year, average hourly earnings rose by 4.3 percent and average weekly earnings grew by 4.0 percent. (See table B-3.)

The Employment Situation for June 2001 is scheduled to be released on Friday, July 6, at 8:30 A.M. (EDT).

## Expansion of the Current Population Survey (Household Survey) Sample

Beginning in September 2000, the Census Bureau expanded the monthly sample for the Current Population Survey (CPS) to meet the requirements of the State Children's Health Insurance Program (SCHIP) legislation. This legislation requires that the Census Bureau improve state estimates of the number of children who live in low-income families and lack health insurance. These estimates are obtained from the Annual Demographic Supplement to the CPS. The expansion of the monthly CPS sample was one part of the Census Bureau's plan for strengthening the SCHIP estimates. The monthly CPS sample was increased in 31 states and the District of Columbia, and the total number of households eligible for the survey rose from about 50,000 to about 60,000. The additional households were introduced into the survey over a 3-month period beginning in September 2000.

In the September 2000 Employment Situation news release (USDL 00-284), the Bureau of Labor Statistics (BLS) stated that it would not use the additional sample to produce the official national labor force estimates prior to the release of July 2001 data in August. This delay would allow BLS sufficient time to evaluate the differences, if any, between the estimates obtained from the current 50,000-household sample and the expanded 60,000-household sample. BLS evaluated the monthly data for the November 2000-April 2001 period and found no significant differences in the national labor force estimates derived from the two samples. Thus, BLS plans to incorporate the additional sample into the July 2001 official national estimates. Since estimates from the two samples were virtually identical, household data for the first 6 months of 2001 will not be revised.

The August 2001 issue of Employment and Earnings will contain an article discussing this sample expansion in more detail.

## Revisions to Establishment Survey Data

In accordance with annual practice, the establishment survey data have been revised to reflect comprehensive universe counts of payroll jobs (benchmarks). These counts are derived principally from unemployment insurance tax records for March 2000; the benchmark process resulted in revisions to all unadjusted data series from April 1999 forward, the time period since the last benchmark was established. All seasonally adjusted data beginning with January 1996 also have been revised, in accordance with the usual practice of revising 5 years of data.

In addition to the routine benchmark revisions, all estimates for the mining and manufacturing industries from April 1999 forward have been revised to incorporate a new sample design. Construction industry estimates from April 2000 forward incorporate the new sample design. These industries are the second group to convert to a probability-based sample under a 4-year phase-in plan for the Current Employment Statistics (CES) sample redesign project.

Table B presents revised total nonfarm employment data on a seasonally adjusted basis for the period January 2000 through April 2001. The revised data for April 2000 forward incorporate the effect of applying the rate of change measured by the sample to the new benchmark level, as well as updated bias and net business birth/death model adjustments and new seasonal adjustment factors. The total nonfarm employment level for March 2000 was revised upward by 468,000 ( 432,000 on a seasonally adjusted basis). The previously published level for April 2001 was revised upward by 405,000 (445,000 on a seasonally adjusted basis).

The June 2001 issue of Employment and Earnings will contain an article that discusses the benchmark, the post-benchmark revisions, and the introduction of probability-based sample estimates for mining, construction, and manufacturing. (The article is available on the Internet at the address shown below.) This issue also will provide revised seasonal adjustment factors for March through October 2001 and revised estimates for all regularly published tables containing national establishment survey data on employment, hours, and earnings.

LABSTAT, the BLS public database on the Internet, contains all revised historical CES data. The data can be accessed through the CES homepage at http://www.bls.gov/ceshome.htm.

Further information on the revisions released today may be obtained by calling 202-691-6555 or via the Internet on the CES homepage.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 50,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. In June 2001, the sample included about 350,000 establishments employing about 39 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys
Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local government entities. Employees on nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:
--The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
--The household survey includes people on unpaid leave among the employed. The establishment survey does not.
--The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
--The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major agesex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December
period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90 -percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90 -percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 292,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from -192,000 to 392,000 (100,000 292,000). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90 -percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90 -percent confidence interval would be greater than zero. In this case, it is likely (at least a 90 -percent chance) that an employment rise had, in fact, occurred. The 90 -percent confidence interval for the monthly change in unemployment is 273,000, and for the monthly change in the unemployment rate it is .19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly sample-based change. The size of the
monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.3 percent, ranging from zero to 0.7 percent.

Additional statistics and other information
More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 26.00$ per issue or $\$ 50.00$ per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-H of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

1 These series are not published seasonally adjusted because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
2 Includes other industries, not shown separately
P = preliminary.
NOTE: Data have been revised to reflect March 2000 benchmarks; the introduction of probability-based sample estimates for mining, construction, and manufacturing; and recomputed seasonal adjustment factors.

Table B-2. Average weekly hours of production or nonsupervisory workers1 on private nonfarm payrolls by industry

|  | Not seasonally adjusted |  |  |  | Seasonally adjusted |  |  |  |  |  |

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonfarm payrolls.
2 This series is not published seasonally adjusted because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
$p=$ preliminary.
NOTE: Data have been revised to reflect March 2000 benchmarks; the introduction of probability-based sample estimates for mining, construction, and manufacturing; and recomputed seasonal adjustment factors.

1 Based on seasonally adjusted data for 1-, 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span
= preliminary
NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment. Data have been revised to reflect March 2000 benchmarks; the introduction of probability-based sample estimates for mining, construction, and manufacturing; and recomputed seasonal adjustment factors.

[^0]:    1 Unemployment as a percent of the civilian labor force,
    2 Seasonally adjusted unemployment data for service occupations are not available because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
