## THE EMPLOYMENT SITUATION: JUNE 2001

Nonfarm payroll employment fell by 114,000 in June, and the unemployment rate was little changed, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Manufacturing experienced another large job loss, and wholesale trade employment declined for the third consecutive month. Other major industry groups showed no significant change in employment over the month.

## Unemployment (Household Survey Data)

Both the unemployment rate ( 4.5 percent) and the number of unemployed persons ( 6.4 million) were little changed in June. In each of the past 3 months, the jobless rate has been either 4.4 or 4.5 percent; its most recent low was 3.9 percent in October 2000. The rates for all the major worker groups-adult men (4.0 percent), adult women (3.8 percent), teenagers (14.3 percent), whites ( 4.0 percent), blacks ( 8.4 percent), and Hispanics ( 6.6 percent)--showed little or no change over the month. (See tables A-1 and A-2.)

Total Employment and the Labor Force (Household Survey Data)
Total employment, at 134.9 million, was little changed in June. Since January, it has declined by about 1.1 million. Over the month, the employmentpopulation ratio decreased to 63.7 percent and has fallen by 0.8 percentage point since January.

The civilian labor force (141.4 million) was essentially unchanged over the month, after seasonal adjustment, and the labor force participation rate--the proportion of the population 16 years of age and older who are either working or looking for work--remained at 66.8 percent. Since January, the participation rate has declined by half a percentage point. (See table A-1.)

The number of persons working part time for economic reasons increased by 266,000 to 3.6 million. This was about half a million more than a year earlier. These persons indicated that they would like to work full time but worked part time because their hours had been cut back or they were unable to find a full-time job. (See table A-4.)

In June, 7.3 million persons (not seasonally adjusted) held more than one job. These multiple jobholders represented 5.4 percent of the employed, the same as a year earlier. (See table A-10.)

Persons Not in the Labor Force (Household Survey Data)
In June, 4.6 million people not in the labor force (seasonally adjusted) reported that they currently wanted a job. These individuals are not counted as unemployed because they had not searched for work in the 4 weeks preceding

Table A. Major indicators of labor market activity, seasonally adjusted (Numbers in thousands)

the survey. Indeed, most had not searched for work in the prior year. (See table A-1.) Among persons who wanted a job, about 1.2 million (not seasonally adjusted) were marginally attached to the labor force in June. These were people who were available for work and had looked for a job sometime in the prior 12 months. In June, the number of discouraged workers was 291,000. Discouraged workers, a subset of the marginally attached, were not currently looking for work specifically because they believed no jobs were available for them. (See table A-10.)

Industry Payroll Employment (Establishment Survey Data)
Nonfarm payroll employment fell by 114,000 in June to 132.4 million, seasonally adjusted. This was the second decline in the past 3 months (as revised) and brought total job losses in the second quarter to 271,000. Manufacturing employment continued to fall sharply in June, and related industries such as wholesale trade and transportation also lost jobs. The other major industry groups had little or no change in employment over the month. (See table B-1.)

Manufacturing lost 113,000 jobs in June. Since last July, the industry has lost 785,000 jobs, with nearly three-quarters of the decline coming since the end of 2000. In June, employment losses in manufacturing again were widespread, with the largest declines occurring in electronic equipment (31,000), industrial machinery (22,000), and fabricated metals and textiles ( 8,000 each). Job losses in electronic equipment and industrial machinery have accelerated over the past 3 months, as they also have in textiles, furniture, and printing and publishing.

Construction employment was little changed in June and was down over the second quarter (seasonally adjusted). Strong job growth in the first quarter may have lessened the need for the industry to add workers during the spring buildup. Monthly job growth in the industry has averaged 15,000 thus far in 2001, slightly below the average monthly growth for all of 2000.

In mining, employment continued to rise in oil and gas extraction, although June's gain was the smallest this year.

In the service-producing sector, employment in wholesale trade decreased sharply for the third consecutive month. Employment declines in this industry have totaled 42,000 since March, reflecting cutbacks in both domestic industrial production and imports.

Employment in transportation and public utilities declined by 11,000 in June. All of the loss occurred in transportation. Manufacturing's severe downturn continued to affect the movement of goods both by truck and air. Employment in air transportation also has been affected by reductions in business travel.

Employment in services was flat in June, following a gain of 65,000 (as revised) in May. Strong job gains in health services, engineering and management services, motion pictures, and computer services were offset by large losses in help supply services, hotels, amusements and recreation, and educational services. Since reaching its peak last September, the help supply industry has lost 379,000 jobs.

Employment in finance, insurance, and real estate was little changed in June. Employment gains continued in commercial banks and in mortgage banks; these were offset by declines in insurance and real estate and continued losses in security brokerages, which have shed 12,000 jobs since March.

In June, employment in retail trade also was little changed. Job gains in eating and drinking places and building materials and garden supplies were partially offset by continued losses in food stores. Job gains in retail trade have averaged 24,000 a month in 2001, about the same as the monthly average for all of last year.

In government, small job gains in state and local government more than offset losses in the federal government. Average monthly job gains in local government thus far in 2001 have been considerably larger than in 2000.

Weekly Hours (Establishment Survey Data)
The average workweek for production or nonsupervisory workers on private nonfarm payrolls was unchanged in June at 34.3 hours, seasonally adjusted. The manufacturing workweek edged down by 0.1 hour to 40.7 hours. Manufacturing overtime was up by 0.1 hour to 4.0 hours. Over the past 12 months, the factory workweek has fallen by 1.0 hour and factory overtime by 0.6 hour. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls declined by 0.2 percent in June to 151.2 (1982=100), seasonally adjusted. The manufacturing index fell by 1.0 percent to 98.2. The manufacturing index has fallen by 7.9 percent over the past 12 months and is now at its lowest level since March 1983. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls increased by 4 cents in June to $\$ 14.29$, seasonally adjusted. Over the month, average weekly earnings increased by 0.3 percent to $\$ 490.15$. Over the year, average hourly earnings rose by 4.2 percent and average weekly earnings grew by 3.6 percent. (See table B-3.)

The Employment Situation for July 2001 is scheduled to be released on Friday, August 3, at 8:30 A.M. (EDT).

Expansion of the Current Population Survey (Household Survey) Sample
Beginning in September 2000, the Census Bureau expanded the monthly sample for the Current Population Survey (CPS) to meet the requirements of the State Children's Health Insurance Program (SCHIP) legislation. This legislation requires that the Census Bureau improve state estimates of the number of children who live in low-income families and lack health insurance. These estimates are obtained from the Annual Demographic Supplement to the CPS. The expansion of the monthly CPS sample was one part of the Census Bureau's plan for strengthening the SCHIP estimates. The monthly CPS sample was increased in 31 states and the District of Columbia, and the total number of households eligible for the survey rose from about 50,000 to about 60,000. The additional households were introduced into the survey over a 3-month period beginning in September 2000 .

In the September 2000 Employment Situation news release (USDL 00-284), the Bureau of Labor Statistics (BLS) stated that it would not use the additional sample to produce the official national labor force estimates prior to the release of July 2001 data in August. This delay would allow BLS sufficient time to evaluate the differences, if any, between the estimates obtained from the current 50,000-household sample and the expanded 60,000-household sample. BLS evaluated the monthly data for the November 2000-April 2001 period and found no significant differences in the national labor force estimates derived from the two samples. Thus, BLS plans to incorporate the additional sample into the July 2001 official national estimates. Since estimates from the two samples were virtually identical, household data for the first 6 months of 2001 will not be revised.

The August 2001 issue of Employment and Earnings will contain an article discussing this sample expansion in more detail.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 50,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. In June 2001, the sample included about 350,000 establishments employing about 39 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys
Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local government entities. Employees on nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:
--The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
--The household survey includes people on unpaid leave among the employed. The establishment survey does not.
--The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
--The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major agesex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December
period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a $90-\mathrm{percent}$ chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90 -percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 292,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from -192,000 to 392,000 (100,000 292,000). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90 -percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90 -percent chance) that an employment rise had, in fact, occurred. The 90 -percent confidence interval for the monthly change in unemployment is 273,000, and for the monthly change in the unemployment rate it is .19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly sample-based change. The size of the
monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.3 percent, ranging from zero to 0.7 percent.

Additional statistics and other information
More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 26.00$ per issue or $\$ 50.00$ per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-H of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

1 Unemployment as a percent of the civilian labor force.

Table A-10. Persons not in the labor force and multiple jobholders by sex, not seasonally adjusted
(Numbers in thousands)

1 Data refer to persons who have searched for work during the prior 12 months and were available to take a job during the reference week.
2 Includes thinks no work available, could not find work, lacks schooling or training, employer thinks too young or old, and other types of discrimination. 3 Includes those who did not actively look for work in the prior 4 weeks for such reasons as
4 Includes persons who work part time on their primary job and full time on their secondary job(s), not shown separately.

Table B-1. Employees on nonfarm payrolls by industry
(In thousands)

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and
nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonfarm payrolls.
2 This series is not published seasonally adjusted because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
$\mathrm{p}=$ preliminary.

1 Based on seasonally adjusted data for 1-, 3-, and 6 -month spans and unadjusted data for the $12-$ month span. Data are centered within the span
= preliminary
unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

[^0]:    1 The population figures are not adjusted for seasonal variation; therefore, identical numbers appear in the unadjusted and seasonally adjusted columns

    NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[^1]:    1 Unemployment as a percent of the civilian labor force
    2 Seasonally adjusted unemployment data for service occupations are not available because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
