Both payroll employment and the unemployment rate were little changed in March, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Manufacturing and construction each lost nearly 40,000 jobs, but services employment grew substantially. Both the manufacturing workweek and overtime hours rose over the month.

Unemployment (Household Survey Data)
The number of unemployed persons ( 8.1 million) and the unemployment rate ( 5.7 percent) were little changed in March. The jobless rate has been within two-tenths of a percentage point of 5.6 percent since October 2001.

The unemployment rate for blacks increased to 10.7 percent in March. Jobless rates for the other major worker groups-adult men ( 5.2 percent), adult women (5.0 percent), teenagers (16.4 percent), whites (5.0 percent), and Hispanics ( 7.3 percent)--showed little or no change. (See tables A-1 and A-2.)

Total Employment and the Labor Force (Household Survey Data)
Total employment fell by 425,000 in March to 133.9 million, after seasonal adjustment. The employment-population ratio declined by 0.2 percentage point to 62.8 percent. Total employment in March was 1.9 million lower than a year earlier, and the employment-population ratio was 1.5 percentage points lower. (See table A-1.)

The civilian labor force ( 142.0 million) and the labor force participation rate ( 66.6 percent) were little changed from February to March. Over the last 12 months, there has been little net change in the labor force while the labor force participation rate has decreased by 0.6 percentage point. (See table A-1.)

About 7.4 million persons (not seasonally adjusted) held more than one job in March. These multiple jobholders represented 5.5 percent of the total employed in March, about the same proportion as a year earlier. (See table A-10.)

Persons Not in the Labor Force (Household Survey Data)
About 1.3 million persons (not seasonally adjusted) were marginally attached to the labor force in March, up from 1.1 million a year earlier. These individuals reported that they wanted and were available for work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed, however, because they had not actively searched for work in the 4 weeks preceding the survey. The number of discouraged workers was 319,000 in March. Discouraged workers, a subset of the marginally attached, were not currently looking for work specifically because they believed no jobs were available for them. (See table A-10.)

Industry Payroll Employment (Establishment Survey Data)
Nonfarm payroll employment, at 131.3 million, was little changed in March ( $+58,000$ ); in February, employment was essentially unchanged ( $-2,000$, as revised). From March 2001 through January 2002, payroll employment fell by an average of 144,000 a month. (See table B-1.)

Table A. Major indicators of labor market activity, seasonally adjusted (Numbers in thousands)

Manufacturing job losses continued, but the declines of 38,000 in March and 54,000 in February were much smaller than in previous months. From January 2001 to January 2002, job losses in the nation's factories averaged 111,000 a month. Over the month, employment in electronic equipment and in industrial machinery decreased by 10,000 and 7,000, respectively, much smaller than their average losses over the past year. Several manufacturing industries had small employment gains in March after many months of losses-stone, clay, and glass $(2,000)$, primary metals $(2,000)$, and rubber and miscellaneous plastics (4,000). Transportation equipment lost 12,000 jobs in March, primarily in aircraft and parts (-9,000, including 2,800 workers on strike). Since September 2001, the aircraft industry has lost 42,000 jobs.

Elsewhere in the goods-producing sector, construction employment decreased by 37,000 in March, after seasonal adjustment. Virtually all the job losses were in heavy construction (-36,000). Mining employment continued on its recent downward trend. Since October, the industry has lost 14,000 jobs, mainly in oil and gas extraction.

Within the service-producing sector, employment in the services industry rose by 118,000, its largest over-the-month increase since September 2000. Help supply services added 69,000 jobs in March. This was the second consecutive month of job growth in the industry, which had lost nearly a fifth of its jobs from September 2000 through January 2002. Employment in engineering and management services increased by 12,000 in March, compared with an average monthly gain of 4,000 in the prior 12 months. Health services employment continued to increase in March, rising by 32,000.

Elsewhere in the private service-producing sector, employment was little changed in March. Within retail trade, food stores continued to lose jobs. In finance, security and commodity brokerages posted a small job gain (2,000), after 3 months of losses totaling 14,000. Employment in insurance fell by 4,000 over the month and has decreased by 20,000 since September 2001. In air transportation, employment edged down in March, reversing gains over the last 2 months. This followed losses totaling 111,000 in the fourth quarter.

In government, employment in local education rose by 27,000 in March. Federal and state government employment were little changed over the month.

Weekly Hours (Establishment Survey Data)
The average workweek for production or nonsupervisory workers on private nonfarm payrolls was unchanged in March at 34.2 hours, seasonally adjusted. The manufacturing workweek increased by 0.4 hour to 41.1 hours, and factory overtime increased by 0.3 hour to 4.2 hours. Since November, manufacturing hours have risen by 0.8 hour and overtime by one-half hour. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls edged up by 0.1 percent in March to 148.8 (1982=100), seasonally adjusted. The index has fallen by 2.2 percent from its recent peak in January 2001. In March, the manufacturing index rose for the first time since January 2001, increasing by 0.8 percent to 93.3. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls increased by 4 cents in March to $\$ 14.67$, seasonally adjusted. Average weekly earnings rose by 0.3 percent to $\$ 501.71$. Over the year, average hourly earnings increased by 3.5 percent and average weekly earnings grew by 3.2 percent. (See table B-3.)

The Employment Situation for April 2002 is scheduled to be released on Friday, May 3, at 8:30 A.M. (EDT).

Planned Changes Affecting Establishment Survey Data
Concurrent with the release of March 2001 benchmark revisions on June 7, 2002, BLS will implement the next phase of a new probabilitybased sample design for the payroll survey. Estimates for the mining, construction, manufacturing, and wholesale trade industries are currently produced using the new sample and methodology. Estimates for the transportation and public utilities; retail trade; and finance, insurance, and real estate industries will incorporate the new sample design with the June 7 release. The new sample for the services industry will be introduced in 2003, concluding the phase-in of the sample redesign. Further information is available on the Internet (http://www.bls.gov/ces/) or by calling (202) 691-6555.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. In June 2001, the sample included about 350,000 establishments employing about 39 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys
Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local government entities. Employees on nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:
--The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
--The household survey includes people on unpaid leave among the employed. The establishment survey does not.
--The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
--The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major agesex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December
period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a $90-\mathrm{percent}$ chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90 -percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 292,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from -192,000 to 392,000 (100,000 +/- 292,000). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a $90-$ percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90 -percent chance) that an employment rise had, in fact, occurred. The $90-$ percent confidence interval for the monthly change in unemployment is +/-273,000, and for the monthly change in the unemployment rate it is +/- . 19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly sample-based change. The size of the
monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.3 percent, ranging from zero to 0.7 percent.

Additional statistics and other information
More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 26.00$ per issue or $\$ 50.00$ per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-H of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

| U-6 Total unemployed, plus all marginally attached workers, plus total employed part time for economic reasons, as a percent of the civilian labor force plus all marginally attached workers. | 7.6 | 10.1 | 9.8 | (1) | (1) | (1) | (1) | (1) | (1) |
| 1 Not available. |  |  |  |  |  |  |  |  |  |
| this release prior to 1994. Marginally attached workers are persons who currently are neither working nor looking for work |  |  |  |  |  |  |  |  |  |
| but indicate that they want and are available for a job and have looked for work sometime in the recent past. Discouraged workers, a subset of the marginally attached, have given a job-market related reason for not currently looking for a job. |  |  |  |  |  |  |  |  |  |
| Persons employed part time for economic reasons are those who want and are available for full-time work but have had to settle for a part-time schedule. For further information, see "BLS introduces new range of alternative unemployment measures," in the October 1995 issue of the Monthly Labor Review. |  |  |  |  |  |  |  |  |  |

1 These series are not published seasonally adjusted because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.

2 Includes other industries, not shown separately.
$\mathrm{p}=$ preliminary.

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and
nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonfarm payrolls.
2 This series is not published seasonally adjusted because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
$\mathrm{p}=$ preliminary.

Manufacturing payrolls, 136 industries1

1 Based on seasonally adjusted data for 1-, 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span

NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.
