THE EMPLOYMENT SITUATION: MAY 2002

Both payroll employment and the unemployment rate were little changed in May, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Employment rose in the services industry and edged down in manufacturing. Most other major industries showed no significant change.

Unemployment (Household Survey Data)
The number of unemployed persons ( 8.4 million) and the unemployment rate (5.8 percent) were little changed over the month. The May unemployment rate is 1.9 percentage points above its most recent low of 3.9 percent in October 2000, and the number of unemployed persons is 2.8 million higher.

In May, the unemployment rates for blacks (10.2 percent) and Hispanics (7.0 percent) declined. The rates for the other major worker groups--adult men ( 5.2 percent), adult women ( 5.2 percent), teenagers (16.9 percent), and whites ( 5.2 percent)--were little changed. (See tables A-1 and A-2.)

The number of long-term unemployed persons--those unemployed 27 weeks or longer--rose by 142,000 in May, following increases of similar size in March and April. This measure has increased by about 1 million persons over the past 12 months. (See table A-6.)

Total Employment and the Labor Force (Household Survey Data)
The civilian labor force ( 142.8 million) was little changed over the month, and the labor force participation rate held steady at 66.8 percent. The number of employed persons rose in May by 441,000 to 134.4 million. The employment-population ratio edged up to 62.9 percent. (See table A-1.)

About 7.2 million persons (not seasonally adjusted) held more than one job in May. These multiple jobholders represented 5.3 percent of the total employed, compared with 5.5 percent a year earlier. (See table A-10.)

Persons Not in the Labor Force (Household Survey Data)
About 1.5 million persons (not seasonally adjusted) were marginally attached to the labor force in May, up from 1.1 million a year earlier. These individuals reported that they wanted and were available for work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed, however, because they had not actively searched for work in the 4 weeks preceding the survey. The number of discouraged workers was 407,000 in May. Discouraged workers, a subset of the marginally attached, were not currently looking for work specifically because they believed no jobs were available for them. (See table A-10.)

The establishment data in this release have been revised as a result of the annual benchmarking process; the introduction of probability-based sample estimates for transportation and public utilities, retail trade, and finance, insurance, and real estate; and the updating of seasonal adjustment factors. More information| on the revisions is contained in the note beginning on page 4.

1/ Establishment data have been revised to reflect March 2001 bench-
marks; the introduction of probability-based sample estimates for transportation and public utilities, retail trade, and finance, insurance, and real estate; and recomputed seasonal adjustment factors.

2/ Includes other industries, not shown separately.
3/ Data relate to private production or nonsupervisory workers.
p=preliminary.

## Industry Payroll Employment (Establishment Survey Data)

Total nonfarm payroll employment, at 130.7 million, was little changed ( $+41,000$ ) for the third consecutive month. From the start of the recession in March 2001 through February 2002, job losses had averaged 160,000 a month. (See table B-1.)

Employment in the services industry rose by 68,000 in May, following gains of similar magnitude in the prior 2 months. Employment growth in help supply services explains a large portion of the recent increases in the services industry. In May, help supply services added 25,000 jobs, for a gain of 126,000 since February. The industry had lost 806,000 jobs from September 2000 through February 2002. Engineering and management services added 23, 000 jobs in May, notably in management and public relations. Health services also added jobs; the gain (16,000) was about the same as in April, but well below the average for the 12 -month period ending in March. Job losses occurred in hotels and other lodging places (-13,000) for the second month in a row, following little change earlier in the year.

In retail trade, job losses in eating and drinking places and department stores were partly offset by small employment gains in other retail industries over the month. Eating and drinking places lost 33,000 jobs, bringing the decline in the industry so far this year to 59,000. Employment was unchanged in transportation and public utilities, following job losses totaling 347,000 from the industry's last employment peak in February 2001. Air transportation, communications, and transportation services accounted for approximately 85 percent of these losses. In government, employment in local education increased by 26,000 in May; this was partly offset by declines in the noneducation component of state government.

In the goods-producing sector, employment in manufacturing edged down by 19,000 in May; factory job losses have moderated substantially since the beginning of the year. Employment had declined by an average of 115,000 a month from March 2001 through January 2002. A number of manufacturing industries have fared better this year, including industrial machinery, electronic equipment, fabricated metals, and transportation equipment.

Employment in construction was about unchanged in May, as seasonal hiring just met expectations. Although construction has lost 242,000 jobs since March 2001, the decline has been relatively small compared with recent economic downturns. Employment in mining edged down by 3,000 in May. Since its recent peak last September, this industry has lost 11,000 jobs, primarily in oil and gas extraction.

Weekly Hours (Establishment Survey Data)
The average workweek for production or nonsupervisory workers on private nonfarm payrolls was unchanged in May at 34.2 hours, seasonally adjusted. The manufacturing workweek also was unchanged at 40.9 hours, and factory overtime was up by 0.1 hour to 4.3 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls edged down by 0.1 percent in May to 148.2 (1982=100). The manufacturing index was down by 0.2 percent over the month. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)
Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls increased by 3 cents in May to $\$ 14.70$, seasonally adjusted. Average weekly earnings rose by 0.2 percent over the month to $\$ 502.74$. Over the year, both average hourly earnings and average weekly earnings increased by 3.2 percent. (See table B-3.)

The Employment Situation for June 2002 is scheduled to be released on Friday, July 5, at 8:30 A.M. (EDT).

## Revisions to Establishment Survey Data

In accordance with annual practice, the establishment survey data have been revised to reflect comprehensive universe counts of payroll jobs, or benchmarks. These counts are derived principally from unemployment insurance tax records for March 2001; the benchmark process resulted in revisions to all unadjusted data series from April 2000 forward, the time period since the last benchmark was established. All seasonally adjusted data beginning with January 1997 also have been revised, in accordance with the usual practice of revising 5 years of data.

In addition to the routine benchmark revisions, all estimates for the transportation and public utilities and finance, insurance, and real estate industries from April 2000 forward have been revised to incorporate a new sample design. The retail trade industry estimates from April 2001 forward incorporate the new sample design. These industries are the third group to convert to a probability-based sample under a 4 -year phase-in plan for the Current Employment Statistics (CES) sample redesign project. The completion of the phase-in for the redesign, in June 2003 for the services industry, will coincide with the conversion of all establishment survey series from industry coding based on the 1987 Standard Industrial Classification (SIC) system to industry coding based on the North American Industrial Classification System (NAICS).

Table B presents revised total nonfarm employment data on a seasonally adjusted basis for the period January 2001 through April 2002. The revised data for April 2001 forward incorporate the effect of applying the rate of change measured by the sample to the new benchmark level, as well as updated bias and net business birth/death model adjustments and new seasonal adjustment factors. The total nonfarm employment level for March 2001 was revised downward by 123,000 (193,000 on a seasonally adjusted basis). The previously published level for April 2002 was revised downward by 501,000 (523,000 on a seasonally adjusted basis).

The June 2002 issue of Employment and Earnings will contain an article that discusses the benchmark, the post-benchmark revisions, and the introduction of probability-based sample estimates for transportation and public utilities; retail trade; and finance, insurance, and real estate. (The article is available on the Internet at the address shown below.) This issue also will provide revised seasonal adjustment factors for March through October 2002 and revised estimates for all regularly published tables containing national establishment survey data on employment, hours, and earnings.

LABSTAT, the BLS public database on the Internet, contains all revised historical CES data. The data can be accessed through the CES homepage at http://www.bls.gov/ces/.

Further information on the revisions released today may be obtained by calling 202-691-6555 or via the Internet on the CES homepage.

## Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. In June 2002, the sample included over 300,000 establishments employing about 37 million people.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys
Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local government entities. Employees on nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-producing sector.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:
--The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
--The household survey includes people on unpaid leave among the employed. The establishment survey does not.
--The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
--The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

Other differences between the two surveys are described in "Comparing Employment Estimates from Household and Payroll Surveys," which may be obtained from BLS upon request.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

In both the household and establishment surveys, most seasonally adjusted series are independently adjusted. However, the adjusted series for many major estimates, such as total payroll employment, employment in most major industry divisions, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major agesex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

The numerical factors used to make the seasonal adjustments are recalculated twice a year. For the household survey, the factors are calculated for the January-June period and again for the July-December
period. For the establishment survey, updated factors for seasonal adjustment are calculated for the May-October period and introduced along with new benchmarks, and again for the November-April period. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a $90-\mathrm{percent}$ chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90 -percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 292,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from -192,000 to 392,000 (100,000 +/- 292,000). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a $90-$ percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90 -percent chance) that an employment rise had, in fact, occurred. The $90-$ percent confidence interval for the monthly change in unemployment is +/-273,000, and for the monthly change in the unemployment rate it is +/- . 19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth (and other sources of error), a process known as bias adjustment is included in the survey's estimating procedures, whereby a specified number of jobs is added to the monthly sample-based change. The size of the
monthly bias adjustment is based largely on past relationships between the sample-based estimates of employment and the total counts of employment described below.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.3 percent, ranging from zero to 0.7 percent.

Additional statistics and other information
More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for $\$ 26.00$ per issue or $\$ 50.00$ per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." Measures of the reliability of the data drawn from the establishment survey and the actual amounts of revision due to benchmark adjustments are provided in tables 2-B through 2-H of that publication.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

1 Data relate to production workers in mining and manufacturing; construction workers in construction; and nonsupervisory workers in transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for approximately four-fifths of the total employees on private nonfarm payrolls.
2 This series is not published seasonally adjusted because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
$p=$ preliminary.
NOTE: Data have been revised to reflect March 2001 benchmarks; the introduction of probability-based sample estimates for transportation and public utilities; retail trade; and finance, insurance, and real estate; and recomputed seasonal adjustment factors.

Table B-3. Average hourly and weekly earnings of production or nonsupervisory workers1 on private nonfarm payrolls by industry

1 See footnote 1, table B-2.
p = preliminary.
Data have been revised to reflect March 2001 benchmarks; the introduction of probability-based sample estimates for transportation and public utilities; retail trade; and finance, insurance, and real estate; and recomputed seasonal adjustment factors.

Table B-4. Average hourly earnings of production or nonsupervisory workers1 on private nonfarm payrolls by industry, seasonally adjusted

1 See footnote 1, table B-2
2 The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) is used to deflate this series
3 Change was -. 4 percent from March 2002 to April 2002, the latest month available
4 Derived by assuming that overtime hours are paid at the rate of time and one-half.
N.A. = not available

N = preliminary.
NOTE: Data have been revised to reflect March 2001 benchmarks; the introduction of probability-based sample estimates for transportation and public utilities; retail trade; and finance, insurance, and real estate; and recomputed seasonal adjustment factors.

1 Based on seasonally adjusted data for 1-, 3-, and 6 -month spans and unadjusted data for the 12 -month span. Data are centered within the span
= preliminary
NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment. Data have been revised to reflect March 2001 benchmarks; the introduction of probability-based sample recomputed seasonal adjustment factors.

[^0]:    1 Unemployment as a percent of the civilian labor force.
    2 Seasonally adjusted unemployment data for service occupations are not available because the seasonal component, which is small relative to the trend-cycle and irregular components, cannot be separated with sufficient precision.
