December 14, 1984

INDUSTRIAL PRODUCTION

Industrial production increased an estimated 0.4 percent in November following declines of 0.6 percent in September and 0.4 percent in October; output levels for these two months were revised downward. In November, output of consumer goods rose 1.0 percent led by a 7-1/2 percent rebound in automotive products, while the production of materials increased 0.5 percent. However, the output of home goods, business equipment, and construction supplies decreased again. At 165.0 percent of the 1967 average the index for November was 6.2 percent above a year earlier but about half a percent below the levels attained in July and August.

Market Groupings. Output of durable consumer goods increased 2.5 percent as auto assemblies rose to an annual rate of 7.9 million units in November following the strike-depressed rates of about 7.0 million units in both September and October. Home goods production, however, fell 0.6 percent in November following a revised 0.9 percent drop in October. Output of nondurable consumer goods rose moderately further and defense and space equipment continued to advance strongly. Business equipment production edged lower in November and revised data now indicate declines for the preceding two months as well. Production of construction supplies also decline further in November.

Production of durable, nondurable, and energy materials increased in November. The 0.5 percent November increase in the output of total materials followed declines of around one percent in each of the previous two months.

Industry Groupings. Manufacturing output increased 0.4 percent in November after a decline of 0.6 percent in September and 0.1 percent in October. Durable goods manufacturing increased 0.5 percent largely reflecting gains in motor vehicles and parts and in steel. Mining output increased 0.8 percent in November following a 3.9 percent decline in October. Output of utilities edged up in November.

AUGUST	45.3	63.0	61.9
SEPTEMBER	52.1	60.6	61.7
OCTOBER	43.4	43.6	53.0

NOTE: THE DIFFUSION INDEXES SHOW THE PERCENT OF THE INDUSTRIAL PRODUCTION INDEX'S 235 SEASONALLY ADJUSTED COMPONENT SERIES THAT IN THE MONTH INDICATED WERE HIGHER THAN THEY WERE ONE MONTH EARLIER, THREE MONTHS EARLIER, AND SIX MONTHS EARLIER. IN CALCULATING THE DIFFUSION INDEXES HALF OF THE UNCHANGED COMPONENTS ARE COUNTED AS BEING HIGHER AND NO ALLOWANCE IS MADE FOR THE RELATIVE IMPORTANCE OF THE INDIVIDUAL COMPONENTS IN TOTAL INDUSTRIAL PRODUCTION. DIFFUSION INDEXES BASED ON CHANGES OVER A SIX-MONTH PERIOD GENERALLY SHOW MORE PROMOUNCED CYCLICAL PATTERNS THAN DIFFUSION INDEXES BASED ON CHANGES OVER SHORTER PERIODS.

Explanatory Note

Coverage. The industrial production index is a measure of the physical output of the Nation's factories, mines, and electric and gas utilities expressed as a percentage of production in a base period, currently 1967. The 235 individual series representing Standard Industrial Classification (SIC), 1967 edition, codes 10-14, 19-39, 49, and 91 (part) are calculated first as index series relatives. These relatives are aggregated into: (1) market groupings (such as consumer goods, equipment, intermediate products, and materials) from which the total is derived and (2) industry groupings (for example, SIC 2-digit industries) and major aggregates of these groupings, such as manufacturing, mining, and utilities.

Timing. A first estimate of output for a month is published about the 15th of the following month. This estimate may revise in each of the next 3 months as new data become available. After the fourth month, indexes are not further revised until an annual or a benchmark revision.

Source data. The monthly indexes of industrial production are built up from data of two types: (1) directly-measured physical product data, (2) estimates of physical product output derived from input data adjusted by conversion factors that relate these inputs to physical output. The directly measured physical product data (lbs., tons, etc.) are obtained from reports of the Bureau of the Census, Bureau of Mines, other Government agencies, and trade associations. Estimates of physical output based on input data are used when appropriate monthly physical product data are not available. The major input data are (1) hours worked by production workers as indicated by the monthly establishment survey of the Bureau of Labor Statistics, and (2) industrial electric power use as ascertained from utilities by the Federal Reserve Banks. The input conversion estimates are based mainly on their historical trends and recent developments.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 version of the Method II seasonal adjustment procedure developed by the Bureau of the Census. The seasonal adjustment factors for the basic aggregate series in the summary table and in Tables 1 and 2 are reviewed and edited monthly. The seasonal factors currently being used were developed from data through 1983.

Weights. The total index and various groupings of component series are combined on the basis of 1967 value-added weights (shown in the first column of the index tables). The gross-value-weighted product series are expressed in terms of 1972 dollars.

Formula. The symbolic expression for the total index (I) is:

$$I_t = \Sigma \left(\frac{q_{67} p_{67}}{\Sigma q_{67} p_{67}} \right) \cdot \left(\frac{q_t}{q_{67}} \right) \cdot 100 = \frac{\Sigma q_t p_{67}}{\Sigma q_{67} p_{67}} \cdot 100$$

where q is quantity, p is Census value-added per unit of output, and t represents the t -th period.

Reliability. The median of the revisions in total IP, without regard to sign, between the first and fourth estimates is 0.3 per cent; that is, in about half of the cases the absolute value of the revision from the first to the fourth estimate was less than 0.3 per cent. (Calculated on the basis of data for the January 1972 to December 1982 period.)

Rounding. Changes shown for index components may not aggregate to changes for totals due to independent rounding.
