INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production rose 0.5 percent in June; revisions for the preceding three months were, on net, slightly positive. A surge in demand for electricity, caused by unseasonably hot weather, resulted in a sharp increase in the output of electric utilities. Apart from this rise, total industrial production for the month increased only 0.1 percent.

The utilization of total industrial capacity rose 0.3 percentage point, to 83.9 percent. The rise in operating rates at utilities more than accounted for the gain; the operating rate at factories edged down.

At 116.8 percent of its 1987 average, total industrial production was 5.8 percent higher in June than it was a year earlier. Output grew 4.4 percent at an annual rate in the second quarter, down from 8.3 percent at an annual rate in the first quarter. The slowdown resulted mainly from a decrease in the seasonally adjusted production of motor vehicles, which had been hindered by capacity constraints. Excluding motor vehicles and parts, industrial production rose 6.3 percent at an annual rate last quarter, nearly the same as the pace of the first quarter.

(over)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY

Market Groups

The production of consumer goods advanced 0.6 percent in June, mainly because of the large rise in sales of electricity to residential users. Among other consumer goods, the output of automotive products eased a bit further, reflecting a small decrease in car assemblies. The production of other durable goods, such as appliances and furniture, increased about 1 percent, partially retracing the May decline. On balance, the output of these goods has changed little since last fall. The output of nondurable goods other than energy products was unchanged.

The production of business equipment excluding cars and trucks rose 0.6 percent in June, after an average monthly gain over the preceding three months of almost 1 percent. The deceleration in growth reflected, in part, strike-related losses in construction and mining machinery. Even so, the output in this sector advanced at an annual rate of about 11 percent during the second quarter, only about 1 percentage point less than the growth rate for the first quarter.

The output of construction supplies, which had risen sharply in March and April, recently posted small gains. The large rise in the production of business supplies reflected the weather-related increase in sales of electricity to commercial users. Among non-energy materials, production rose 0.2 percent, about the same as gains in each of the two preceding months. Increases in the output of basic metals and parts for equipment were largely offset by decreases in the production of paper materials and parts for consumer durable goods.

Industry Groups

Manufacturing production moved up 0.2 percent in June, about the same rate of increase as in both May and April. Excluding motor vehicles and parts, factory output rose 0.2 percent, down from the 0.5 percent gains registered in both May and April. The slower rate of increase reflected mainly a softening in the output of nondurables, particularly paper, apparel, and petroleum products; also contributing to the slower increase was the production of chemicals, which had risen sharply in May but was about unchanged last month. Despite the recent slowing, the output of manufacturing excluding motor vehicles and parts grew at an annual rate of about 7-1/2 percent in the second quarter, up from the annual growth rate of 5-3/4 percent in the first quarter.

Total factory utilization edged down again in June, to 82.8 percent, as the operating rates for both primary-processing and advanced-processing industries declined slightly. The operating rates for most major industries decreased; the only significant increases occurred in the furniture and instruments industries. Even though the overall factory operating rate has eased a bit over the past two months, the utilization rates for many industries, including lumber, primary metals, textiles, petroleum products, and machinery, remain well above their long-run averages. Moreover, the recent levels of factory utilization for petroleum products and machinery have been running above their previous cyclical highs of the late 1980s.

Mining output declined 0.5 percent in June owing to another large decrease in coal mining. The output at utilities increased more than 5 percent, reflecting the effects of the severe weather on electricity demand.

NOTICE

Data on electric power use have been revised back to December 1991. These changes reflect revisions to the underlying source data, changes in the reporting panel, and updated seasonal factors. The revised data are on the regular diskette that contains data from the G.17 (419) statistical release, available from the Publications Services, Mail Stop 127, Board of Governors of the Federal Reserve System, Washington, DC 20551. The revisions are also available on the Department of Commerce Economic Bulletin Board and, in hard copy, by request to the Industrial Output Section, Mail Stop 82, at the above address.

1. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial and commercial machinery and computer equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

1. Series begins in 1977.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastic products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial and commercial machinery and computer equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. It also includes survey data on the use of electric power in manufacturing and mining. Data in the release are available on-line on the day of issue through the Economic Bulletin Board of the Department of Commerce. For information, call (202) 482-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries. For the period since 1987, the total IP index has been constructed from 255 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified and grouped in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

Market groups. For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products, and final products are divided into consumer goods and equipment.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976. In 1993, a revision that converted the indexes to the 1987 SIC from 1987 forward was published.

Source data. In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the Bureau of Mines; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

Weights. In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built in chronological segments that are linked together to form a continuous index expressed as a percentage of output in a comparison base year (currently 1987). Each segment, which usually spans five years, is a Laspeyres quantity index showing changes in quantities with prices (Census value added per unit of output) held at base-year values for the segment. For the period from 1987 to the present, IP is aggregated on the basis of 1987 value-added weights. The aggregation of the index for the 1982-86 period is based on 1982 weights, whereas 1977 weights are used for the 1977-81 period. The other weight years in the postwar period are 1972, 1967, 1963, 1958, 1954, and 1947. The 1987 value-added weights used to aggregate the index are shown in the first column of tables 1, 2, and 6, in the "1987" column under the heading "Proportion in total IP." Proportions for the most recent complete year of data are shown in the second column of tables 1, 2, and 6.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 1993; for other series, the factors were estimated with data through July 1993. In some cases, series were preadjusted for the effects of holidays or the business cycle before using X-11 ARIMA. The seasonally adjusted total index is calculated by aggregating the seasonally adjusted major market groups, and may not precisely equal an aggregation of the seasonally adjusted industry groups.

Reliability. The average revision to the level of the total IP index, without regard to sign, between the preliminary estimate and its third revision (or from the first and the fourth estimates) was 0.35 percent during the 1972-92 period. The average revision to the percent change in total IP, without regard to sign, from the first to the fourth estimates was 0.26 percentage point during the same period. In most cases (about 85 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. In some cases, components may not add to totals because of independent rounding. In addition, the published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

References. *Industrial Production—1986 Edition* contains a more detailed description of the methods used to compile the index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The 1990 and 1993 revisions were described in the *Federal Reserve Bulletin*, vol. 76 (April 1990), pp. 187-204 and vol. 79 (June 1993), pp. 590-605, respectively. The 1994 revision to the index was described in the *Federal Reserve Bulletin*, vol. 80 (March 1994), pp. 220-6.

Capacity Utilization

Definition. Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 75 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital stock.

Groups. Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

Weights. Value-added proportions are used to weight the individual capacity indexes in aggregations in the same manner as individual IP series are aggregated to the total index of industrial production. Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in base-period value-added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates as high as 90 percent have been exceeded only in wartime.

References. The basic methodology used to estimate capacity and utilization is discussed in the *Federal Reserve Bulletin*, vol. 71 (October 1985), pp. 754-66. The 1990 and 1993 revisions were described in the *Federal Reserve Bulletin*, vol. 76 (June 1990), pp. 412-35 and vol. 79 (June 1993), pp. 590-605, respectively. The 1994 revision to the index was described in the *Federal Reserve Bulletin*, vol. 80 (March 1994), pp. 220-6.

Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry's or group's usage in 1987. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1987 censuses of those industries. The supplementary group, "Total, less nuclear nondefense," is shown separately because the nondefense nuclear material series (part of SIC 2819) accounts for a disproportionately large part of total electric power use. Because the value-added proportion for this industry in total IP is considerably smaller than its share of total electric power use, excluding this component from total power use facilitates comparisons with total IP.

Release Schedule for 1994

At 9:15 a.m. on January 14, February 15, March 15, April 15, May 16, June 15, July 15, August 15, September 16, October 14, November 15, and December 14.
