G.17 (419)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production increased 0.4 percent in May, about the same as in the previous two months; April growth was revised up to 0.3 percent, and March growth was revised down to 0.4 percent. The production of motor vehicles partially rebounded in May, as one of the strikes that had begun in April ended in early May. Continued strength in commercial aircraft and the high-technology sector also contributed to the widespread gains among durable manufacturing industries. In addition, coal production jumped substantially, apparently in response to demand by electric utilities to replenish inventories. At 119.7 percent of its 1992 average, industrial production in May was 4.3 percent above its level of May 1996. The rate of industrial capacity utilization edged up 0.1 percentage point, to 83.7 percent.

Market Groups

The output of consumer goods was about unchanged; gains in the production of durable goods were offset by declines in nondurable consumer goods. Among durables, the output of motor vehicles recovered about one-fifth of (over)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY

the strike-related decline in April. The production of appliances and home computing, video, and audio equipment regained about two-thirds of April's decline. The production of nondurable consumer goods other than energy products—namely food, clothing, and consumer chemical products—eased slightly. A decrease in residential electricity sales more than accounted for a 1 percent decrease in the output of consumer energy products; temperatures were relatively cool in May, reducing the need for air conditioning.

The output of business equipment rose 0.5 percent, with most major categories posting gains. The output of information processing equipment continued to contribute to the growth in this sector. In addition, the ongoing strength in commercial aircraft in combination with the rebound in business autos and trucks boosted the production of transit equipment. The output of industrial equipment, which is now estimated to have jumped in April, edged down, while the other equipment category advanced solidly for another month, led by further strength in service industry machinery and office furniture.

The output of construction supplies reversed slightly less than one-half of April's loss, putting it near the upper end of its range during the past several months. The production of materials rose 0.7 percent, led by another sizable gain in the output of durable goods materials. Among the components of durable materials, the output of equipment parts, particularly semiconductors, rose sharply. The production of parts for consumer durables, mainly for motor vehicles, also increased. Energy materials rose 0.3 percent, as the large increase in coal production more than offset the decline in electricity generation. The output of nondurable goods materials was about unchanged.

Industry Groups

Manufacturing output increased 0.5 percent after a 0.2 percent increase in April. Excluding motor vehicles and parts, the output in manufacturing rose 0.5 percent, just slightly faster than in the previous two months. Much of the strength in the past few months reflects the increased output of durable goods; the production of nondurables is little changed from the end of last year. Gains were widespread within the durable goods sector, with only miscellaneous manufacturing and the stone, clay, and glass industry declining. Increases were especially strong in electrical machinery and primary metals. The production of nondurables increased 0.2 percent, recovering all of the April decline. Gains in the output of petroleum, rubber and plastics, paper, textile mill products, and printing more than offset weakness in other categories.

A pickup in oil and gas drilling activity as well as sharply higher coal production raised mining output, but utility output fell.

The factory operating rate edged up 0.1 percentage point, to 82.7 percent; the level has changed little in recent months. The utilization rate for advanced-processing industries increased 0.1 percentage point, to 80.7 percent, which is just slightly above its long-term average. The rate for primary-processing industries rose 0.4 percentage point, to 87.5 percent, but remained below its recent high of 89.6 percent in December 1994. Among the primary-processing industries, the rate of utilization increased for all industries except primary chemicals; stone, clay, and glass; and fabricated metals.

Note: The data published in this release reflect the semiannual revision to seasonal factors for motor vehicle assemblies and series that use production worker hours as their monthly indicator. Seasonal factors were not changed prior to February 1997.

1. The IP proportion data are estimates of the industries' relative contributions to overall IP growth in the following year.

2. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

1. Series begins in 1977.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastic products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Data in the release and historical data are available under statistical releases at <http://www.bog.frb.fed.us>, the Board's World Wide Web site. These data are also available on line on the day of issue through the Economic Bulletin Board of the Department of Commerce. For information, call (202) 482-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1992. For the period since 1992, the total IP index has been constructed from 264 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

Market groups. For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products, and final products are divided into consumer goods and equipment.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976.

Source data. In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the Department of the Interior; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

Weights. In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built as an annually weighted chain-type index since 1977. The components of IP are combined using estimates of value added per unit of output. For months from January to June, the weights are drawn from the year containing the month being estimated and the preceding year; for months from July to December, the weights are drawn from the current and following year. The IP proportions shown in column 1 of tables 1A, 2A, and 6 are estimates of the industries' relative contributions to overall growth in the following year. For example, a 1 percent increase in durable goods manufacturing in 1997 would account for an increase in total IP of nearly 1/2 percent.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 1996; for other series, the factors were estimated with data through at least June 1996. In some cases, series were preadjusted for the effects of holidays or the business cycle before using X-11 ARIMA. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the level of the total IP index, without regard to sign, between the first and the fourth estimates was 0.28 percent during the 1987-96 period. The average revision to the percent change in total IP, without regard to sign,

from the first to the fourth estimates was 0.21 percentage point during the 1987-96 period. In most cases (about 81 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

Capacity Utilization

Definition. Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 76 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital input.

Groups. Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

Weights. Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in current-period value added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime.

Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry's or group's usage in 1992. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1992 censuses of those industries. The supplementary group, "Total, less nuclear nondefense," is shown separately because the value-added proportion for the nondefense nuclear material series (part of SIC 2819) in total IP is considerably smaller than its share of total electric power use. Excluding this component from total power use facilitates comparisons with total IP.

References

The annual revision published in January, including a description of the aggregation methods for industrial production and capacity utilization, is described in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67-92. In addition, the most recent revision to the electric power use data is discussed in that article.

Industrial Production—1986 Edition contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, and January 1996). The basic methodology used to estimate capacity and utilization is discussed in the June 1990 *Federal Reserve Bulletin*.

Release Schedule for 1997

At 9:15 a.m. on January 17, February 14, March 14, April 16, May 15, June 17, July 16, August 14, September 16, October 17, November 17, and December 15.
