INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production was unchanged in January. Manufacturing output increased 0.1 percent, and utility output increased 0.2 percent, but production at mines decreased 1.8 percent. At 136.7 percent of its 1992 average, manufacturing production in January was 2.2 percent higher than it had been in January 1998. Overall capacity utilization in January slipped 0.3 percentage point, to 80.5 percent, 1-1/2 percentage points below its 1967-98 average.

Market Groups

The output of durable consumer goods, which increased 0.3 percent, was lifted by an increase in automotive products. In contrast, the production of nondurable consumer goods excluding energy fell 0.3 percent and was down 2-1/4 percent from its level a year ago, a drop reflecting, in part, softness for clothing and paper products. The output of consumer energy products, which has been volatile recently, rose noticeably again in January.

(over)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY

Utilities	87.4	75.9	92.6	87.2	92.0	87.9	90.0	90.1	.9

The production of business equipment edged down 0.1 percent. Declines in the output of industrial equipment and transit equipment more than offset a gain in information processing equipment. Some of the decrease in transit equipment reflects further reductions in commercial aircraft production, which peaked last fall after having climbed rapidly during the past few years. The output of construction supplies was flat, but at a high level, following strong gains in the fourth quarter. The production of business supplies increased 0.2 percent.

The production of materials inched up 0.1 percent after having risen modestly in the preceding three months. The production of durable goods materials increased 0.5 percent mainly because of strength in the production of semiconductors and computer parts. However, the output of basic metals fell 0.6 percent, continuing the weakness that had begun in early 1998. In addition, the output of consumer durable parts, which rose rapidly late last year, has somewhat eased recently. The production of nondurable materials also edged down 0.2 percent, a move mainly reflecting ongoing weakness in textiles and chemicals.

Industry Groups

Manufacturing output edged up 0.1 percent, with a small gain in the production of durable goods and a slight pullback in the production of nondurable goods. Within durable goods industries, changes in production were mixed. Industries with large increases in production included lumber, furniture, and electrical machinery; industries showing cutbacks included primary metals, transportation equipment (notably civilian aircraft), and miscellaneous manufactures. The production of nondurable goods edged down 0.1 percent in January after having been flat in December. Losses in tobacco, apparel, and leather products more than offset gains in petroleum and food products. Mining production fell again pulled down by a sharp drop-off in coal production and the continued contraction in oil and gas extraction.

The factory operating rate dropped 0.3 percentage point to 79.6 percent—more than 2-1/2 percentage points below the level of January 1998. The utilization rates for advanced-processing and primary-processing industries slipped 0.3 percentage point. The utilization rate for mines fell 1.5 percentage points, to a level about 6 percentage points below its long-term average. Temperatures remained relatively warm, and the operating rate for utilities, at about 90 percent, was little changed.

Notice

The data in this release include preliminary estimates of capacity growth for 1999. The capacity estimates in next months release will incorporate a small change in the method used to interpolate the annual estimates of capacity growth to the monthly frequency. The current monthly capacity figures are computed under the assumption that capacity growth is constant from the beginning to the end of a year but that growth rates change abruptly between the last months of one year and the first months of the next. The new procedure, which allows capacity growth rates to change smoothly over time, will be incorporated in the data beginning with October 1998.

1. The IP proportion data are estimates of the industries' relative contributions to overall IP growth in the following year.

2. Semiconductors include related electronic components.

3. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

1. Series begins in 1977.

2. Semiconductors include related electronic components.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastic products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Table 8
DIFFUSION INDEXES OF INDUSTRIAL PRODUCTION

Percent

Year	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
One Month Earlier												
1996	38.8	64.9	56.0	56.3	60.1	62.3	52.6	58.2	53.4	54.1	55.2	56.7
1997	53.4	65.7	53.7	51.3	53.7	56.3	58.8	49.8	55.6	55.8	61.4	50.9
1998	55.8	47.2	50.2	53.7	49.1	39.3	54.7	46.8	39.7	56.2	49.1	53.6
Three Months Earlier												
1996	44.0	54.9	55.2	67.5	66.4	67.2	61.9	60.8	56.0	59.0	56.7	57.1
1997	58.2	65.7	59.0	62.7	54.9	55.6	60.2	60.9	59.0	58.1	65.5	63.7
1998	59.6	52.1	54.3	49.1	55.4	44.2	46.8	44.6	45.7	47.6	48.3	55.8
Six Months Earlier												
1996	52.6	53.7	57.5	57.8	65.3	71.3	69.8	66.4	63.8	67.5	64.2	56.3
1997	65.3	65.7	63.8	61.6	58.4	62.7	67.3	62.8	63.5	66.9	68.8	65.0
1998	63.7	63.3	61.0	58.1	56.6	48.3	46.8	46.4	43.3	47.6	45.7	51.3

Note—The diffusion indexes are calculated as the percentage of series that increased over the indicated span (one, three, or six months) plus one-half the percentage that were unchanged.

Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Files containing data in the release and historical data are available under statistical releases at <http://www.federalreserve.gov>, the Board's World Wide Web site. For paid access to these files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or (202) 452-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1992. For the period since 1992, the total IP index has been constructed from 264 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

Market groups. For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products, and final products are divided into consumer goods and equipment.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976.

Source data. In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the Department of the Interior; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

Weights. In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built as an annually weighted chain-type index since 1977. The components of IP are combined using estimates of value added per unit of output. For months from January to June, the weights are drawn from the year containing the month being estimated and the preceding year; for months from July to December, the weights are drawn from the current and following year. The IP proportions shown in column 1 of tables 1A, 2A, and 6 are estimates of the industries' relative contributions to overall growth in the following year. For example, a 1 percent increase in durable goods manufacturing in 1997 would account for an increase in total IP of nearly 1/2 percent.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 1998; for other series, the factors were estimated with data through at least June 1998. Series are preadjusted for the effects of holidays or the business cycle where appropriate. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.28 percent during the 1987–97 period. The average revision to the *percent change* in total IP, without regard to sign,

from the first to the fourth estimates was 0.21 percentage point during the 1987–97 period. In most cases (about 83 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

Capacity Utilization

Definition. Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 76 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital input.

Groups. Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

Weights. Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in current-period value added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime.

Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry's or group's usage in 1992. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1992 censuses of those industries. The supplementary group, "Total, less nuclear nondefense," is shown separately because the value-added proportion for the nondefense nuclear material series (part of SIC 2819) in total IP is considerably smaller than its share of total electric power use. Excluding this component from total power use facilitates comparisons with total IP.

References

The annual revision published on November 24, 1998 is described more completely in the *Federal Reserve Bulletin*, vol.85 (January 1999).

A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67–92. *Industrial Production—1986 Edition* contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, and January 1996, February 1997, February 1998, January 1999). The basic methodology used to estimate capacity and utilization is discussed in the June 1990 *Federal Reserve Bulletin*.

Release Schedule for 1999

At 9:15 a.m. on January 15, February 17, March 16, April 16, May 14, June 16, July 16, August 17, September 16, October 15, November 16, and December 15.
