CAPACITY UTILIZATION

February 16, 1984

Manufacturing, Mining, Utilities, and Industrial Materials

Capacity utilization in manufacturing, mining and utilities rose 0.7 percentage point in January to 79.9 percent, the highest rate since September 1981. Manufacturing also operated at 79.9 percent of capacity in January compared to a downward-revised rate of approximately 79 percent that prevailed in the last months of 1983. The rate for mining increased 1 percentage point further in January to 76.2 percent. In contrast, the rate for utilities declined by 2.1 percentage points to 83.9 percent as the unusually low temperatures experienced in December were followed by more typical weather in January.

Within manufacturing, operating rates for producers of durable goods rose 1-1/4 percentage points in January. The rates for the primary metals and transportation equipment industries advanced strongly, but the level of utilization was still quite low for steel, copper, commercial aircraft, ships, and railroad equipment. The utilization rate for nondurable goods industries advanced 0.4 percentage point in January to 81.8 percent, following a slight decline in the last two months of 1983. Some nondurable manufacturing industries have been operating at relatively high rates. The utilization rates for paper and products and for rubber and plastics products were above the highs observed in the 1978-1980 period, and the rate for textile mill products was above the average of the 1967-1982 period.

The overall operating rate for producers of industrial materials rose 0.8 percentage point in January to 80.8 percent which remains below its 1967-82 average of 83.3 percent.

Capacity Utilization: Summary

Definition. This release contains estimates of output, capacity, and capacity utilization for the nation's factories, mines, and electric and gas utilities. Estimates of actual output and capacity output are expressed as percentages of 1987 actual output. Estimates of capacity utilization are calculated as ratios, in percent, of the Federal Reserve's seasonally adjusted indexes of industrial production to the indexes of capacity. The capacity indexes are based on a variety of data, including capacity data in physical units, surveys of capacity growth and utilization rates, and estimates of capital stock growth. Instead of a formal definition of capacity the concept of practical capacity is applied, which is the greatest level of output that a plant can maintain within the framework of a realistic work pattern, taking account of normal downtime, and assuming sufficient availability of inputs to operate machinery and equipment in place. When the capacity indexes for individual industries are aggregated—for example to total manufacturing—no explicit account is taken of possible general equilibrium constraints such as emerging industry bottlenecks.

Groupings. Estimates of capacity and industrial production for manufacturing industries are aggregated to primary processing and advanced processing industries, to durable and nondurable manufacturing industries, and to total manufacturing. The mining, manufacturing, and utilities estimates aggregate to the total index. Industrial materials are items produced and used as inputs by manufacturing plants, mines, and utilities. Industrial materials include many of the items included in the primary processing grouping of manufacturing, as well as some of the output of the advanced processing industries, mines, and utilities—such as iron ore, crude oil, semiconductors, and electricity sold to industry.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent; none of the broad aggregates has ever reached 100 percent. For mining, manufacturing, and utilities as a whole, and for total manufacturing, utilization rates as high as 80 percent have been exceeded only in wartime.

Revisions. The first estimates for a month are published about the 17th of the following month. These estimates may revise in each of the next three months as new data become available. After the fourth month no further revisions are undertaken until an annual or benchmark revision. The median of the revisions in the total manufacturing utilization rate between the first and fourth estimate is 0.3 of a percentage point; that is, in about half of the cases, the absolute value of the revision from the first to the fourth estimate is less than 0.3 of a percentage point.

Sources. The methodology used to estimate the series is discussed in *New Federal Reserve Measures of Capacity and Capacity Utilization*, Federal Reserve Bulletin, July 1983. Revised data from 1967-82 are included in the statistical supplement to the July 1983 capacity utilization release, which may be obtained from Publications Services, Board of Governors of the Federal Reserve System, Washington, D.C. 20551.

Rounding. The rounding algorithms applied to the capacity, output, and utilization rate series are independent. Aggregates are derived from unrounded detailed components.

Release schedule for 1984. Approximately 11 a.m. on February 16, March 16, April 16, May 16, June 18, July 16, August 16, September 17, October 17, November 16, and December 17.
