For Immediate release

CAPACITY UTILIZATION Manufacturing, Mining, Utilities, and Industrial Materials

February 18, 1988

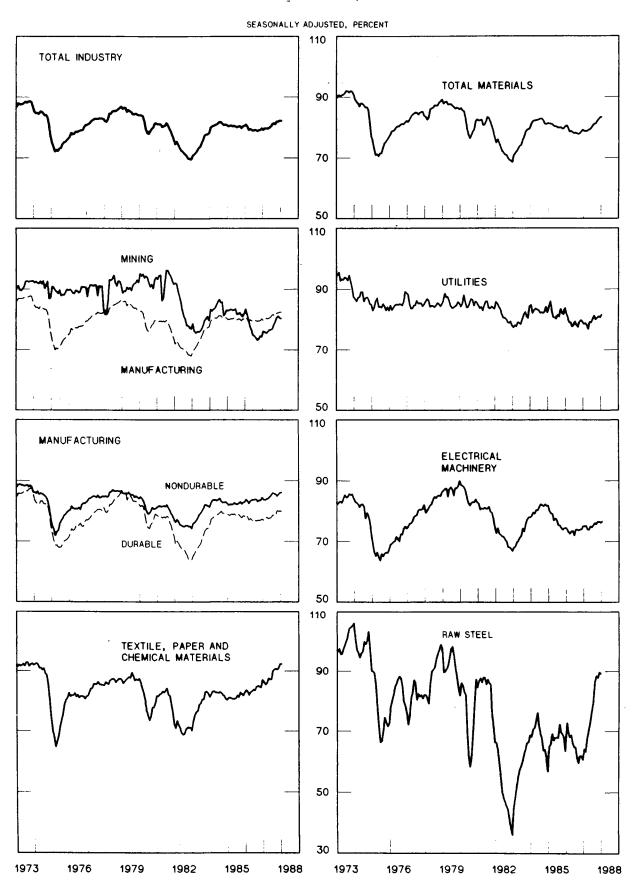

Capacity utilization in manufacturing, mining, and utilities remained at 82.2 percent in January. A weather-related increase in the operating rate at utilities offset a decline in utilization at mines, while the rate at manufacturing facilities was unchanged, on balance, from the December level. Capacity utilization in materials-producing industries remained higher than the industry total, averaging 83.3 percent in January.

Most industries showed relatively stable utilization rates in January. Operating rates within the primary processing, advanced processing, durable manufacturing, and nondurable manufacturing groupings all changed little. The largest changes in factory usage came from a decline in the output of primary metals, which pulled its operating rate back from a high December level, and a cutback in automobile assemblies because of excessive inventories at dealers.

Utilization at producers of energy materials increased in January, offsetting small declines at durable and nondurable goods materials plants. Producers of nondurable goods materials have operated at relatively high utilization rates since the middle of 1987, and the estimate of 90 percent for December 1987 is the highest rate since 1974, with textile, paper, and chemical materials all tight. Durable goods materials industries averaged nearly 80 percent in January, just slightly above their 1967-87 average. However, there is considerable variation by industry within this category. In particular, utilization rates at producers of both aluminum and raw steel are approximately 10 percentage points above their 1967-87 average, while rates for electrical components and some other components used to manufacture finished durable goods appear to be relatively low.

Explanatory Notes

Definition. This release contains estimates of output, capacity, and capacity utilization for the nation's factories, mines, and electric and gas utilities. Output data are the Federal Reserve's seasonally adjusted indexes of industrial production, which express output as percentages of 1977 output. The capacity estimates are expressed as percentages of 1977 output as well. Capacity utilization percentages are calculated as ratios of production to capacity. The capacity indexes are based on a variety of data, including capacity data in physical units complied by trade associations, private and government surveys of capacity growth and utilization rates, and estimates of capital stock growth. The concept of practical capacity is applied, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work pattern, taking account of normal downtime, and assuming sufficient availability of inputs to operate machinery and equipment in place. When the capacity indexes for individual industries are aggregated—for example to total manufacturing—no explicit account is taken of possible general equilibrium constraints such as emerging Industry bottlenecks. Because of the large and heterogeneous database, changes in utilization rates may be more meaningful in the analysis of business conditions than any particular level of these rates.

Groupings. Estimates of capacity and industrial production for manufacturing industries are aggregated to primary processing and advanced processing industries, to durable and nondurable manufacturing industries, and to total manufacturing. The mining, manufacturing, and utilities estimates aggregate to the total index. Primary processing includes textile mill products, paper and products, industrial chemicals, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metal products, and stone, clay, and glass products. Advanced processing includes foods, tobacco products, apparel products, printing and publishing, chemical products such as drugs and tolletries, leather and products, furniture and fixtures, machinery, transportation equipment, instruments, miscellaneous manufactures, and government-owned-and-operated ordnance facilities. Industrial materials are items produced and used as inputs by manufacturing plants, mines, and utilities. Industrial materials include many of the items included in the primary processing grouping of manufacturing, as well as some of the output of the advanced processing industries, mines, and utilities—such as iron ore, crude oil, semiconductors, and electricity sold to industry.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For mining, manufacturing, and utilities as a whole, and for total manufacturing, utilization rates as high as 90 percent have been exceeded only in wartime.

Revisions. The first estimates for a month are published about the 17th of the following month. These estimates may revise in each of the next three months as new data become available. After the fourth month no further revisions are undertaken until an annual or benchmark revision. The median of the revisions in the total manufacturing utilization rate between the first and fourth estimate is 0.3 of a percentage point; that is, in about half of the cases, the absolute value of the revision from the first to the fourth estimate is less than 0.3 of a percentage point.

Sources. The basic methodology used to estimate the series is discussed in Richard D. Raddock, "Revised Federal Reserve Bulletin, Vol. 71 (October 1985, pp. 754-66. Revised data for 1984-65 as well as historical utilization rates since 1967 (1948 in the case of manufacturing) are included in the statistical supplement to the September 1986 capacity utilization release. Copies may be obtained from Publications Services, Board of Governors of the Federal Reserve System, Washington, D.C. 20551

Rounding. Utilization rates are calculated from unrounded capacity and production indexes. Aggregates are derived from unrounded detailed components.

Release schedule for 1988. Approximately 11 a.m. on January 19, February 18, March 17, April 18, May 18, June 16, July 18, August 17, September 16, October 17, November 16, and December 16.
