## CAPACITY UTILIZATION

June 16, 1986

### Manufacturing, Mining, Utilities, and Industrial Materials

Capacity utilization in manufacturing, mining and utilities declined 0.6 percentage point in May to 78.6 percent, more than two percentage points below its level at the start of the year. Sharp declines were experienced in both durable manufacturing and mining while the operating rates for utilities and nondurable manufacturing changed little in May.

The utilization declines in durable manufacturing were widespread—only the aerospace and miscellaneous transportation equipment industry showed any increase in factory usage in May. The largest May decline came in the motor vehicle industry; the operating rate in the auto industry fell to 75 percent in May and has fluctuated between 75 and 85 percent during the first five months of this year. Capacity utilization in both the electrical and the nonelectrical machinery industries dropped below 70 percent in May—about 9 percentage points below the average level of 1967–1985. Production curtailments by producers of high technology items have contributed substantially to the declines in those two industries. Computers and related equipment have yet to show a recovery from their weakness in 1985; moreover, continuing declines in semiconductor production were a major factor in pushing the operating rate for electrical machinery lower in May 1986 than at anytime during 1985.

Utilization in the mining industry has declined about six percentage points since January, principally as the result of the drop in oil and gas well drilling. The weakness in mining has been exacerbated by recent production cutbacks in the coal industry. Operating rates for mining are now below the rates observed during the cyclical lows in 1975 and 1982.

Capacity utilization in total industrial materials fell 0.6 percentage point in May to 78.3 percent. Declines came in durable goods and energy materials industries; the operating rate for nondurable goods materials manufacturers edged up.

### Capacity Utilization: Summary

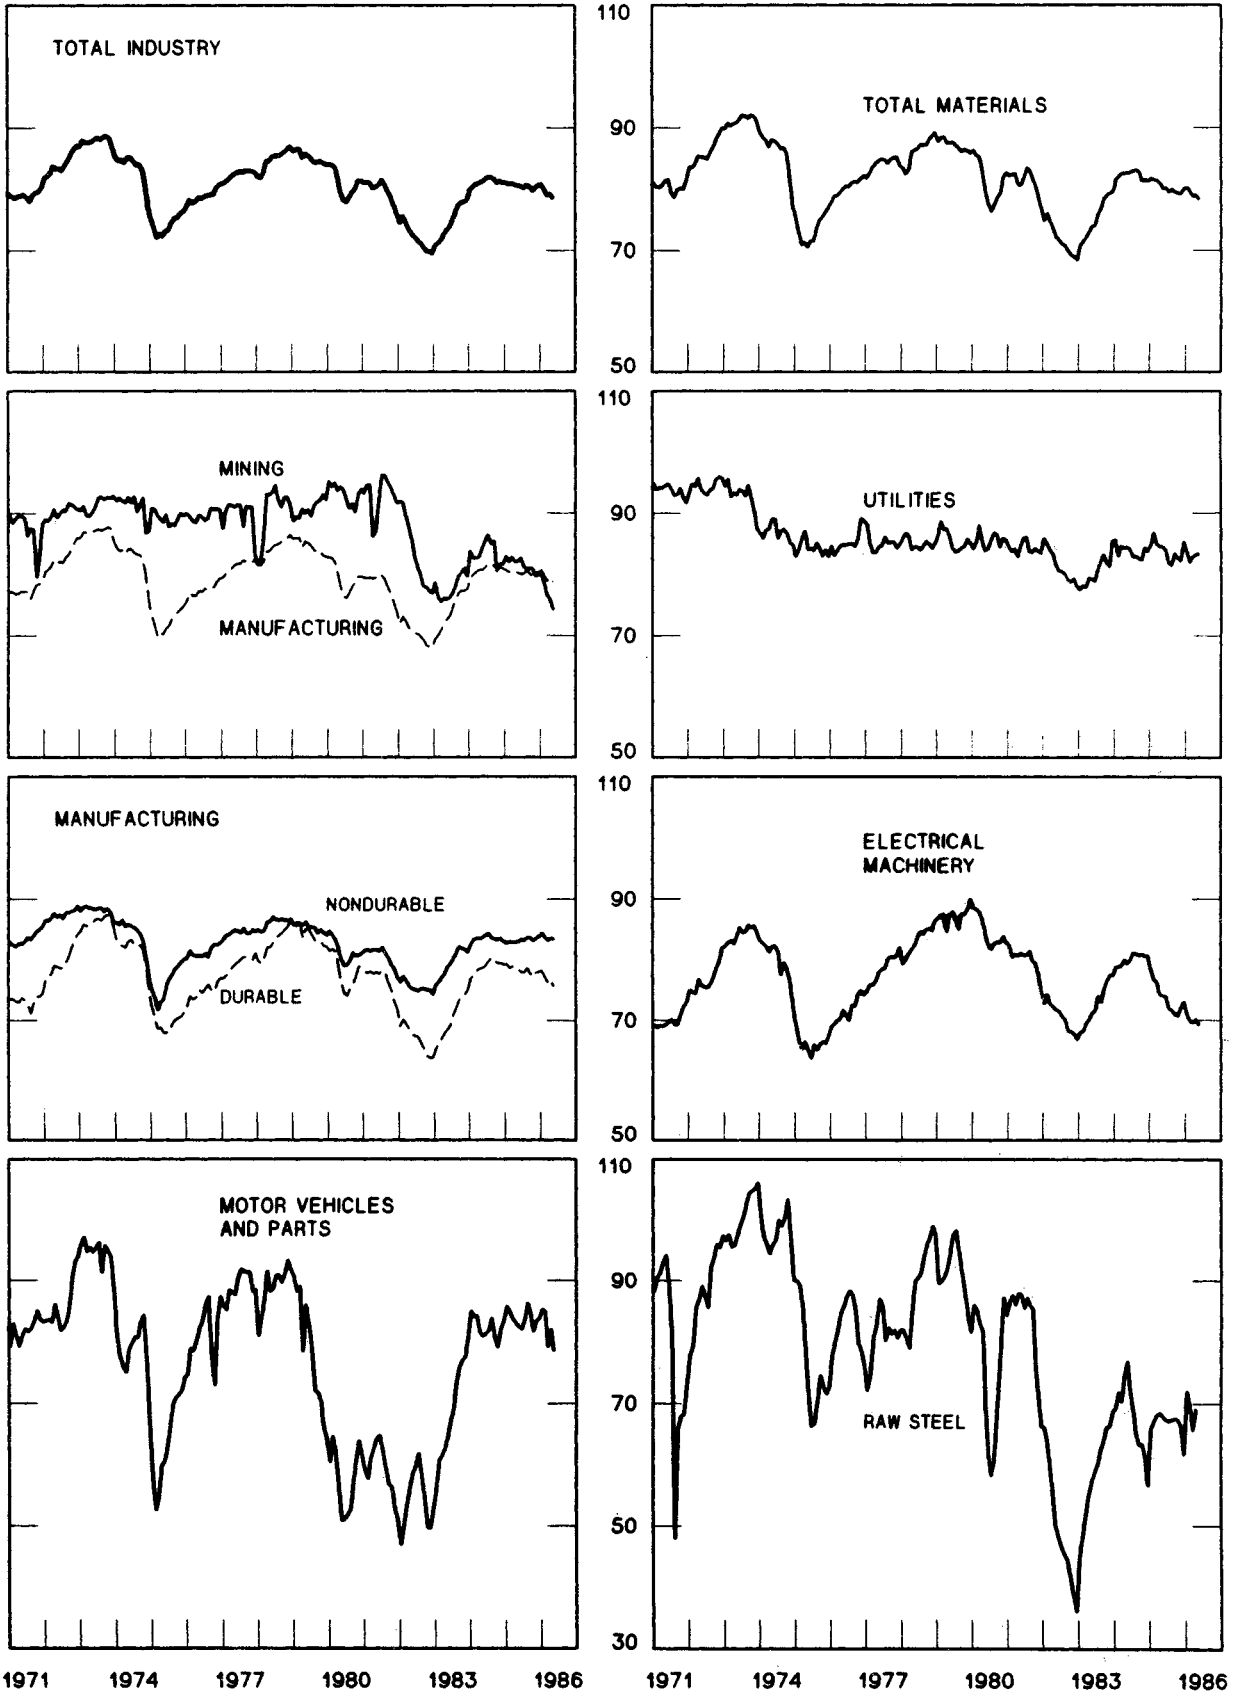

Percent of capacity, seasonally adjusted

Series	1973 High	1975 Low	1978 -80 High	1982 Low	1987 -85 Avg.	1986

Note. Data for output are percentages of 1977 output as shown in the Federal Reserve's seasonally adjusted indexes of industrial production. Capacity is also expressed as a percentage of

1977 actual output. Capacity utilization percentages are calculated as ratios of production to capacity.

**Definition.** This release contains estimates of output, capacity, and capacity utilization for the nation's factories, mines, and electric and gas utilities. Output data are the Federal Reserve's seasonally adjusted indexes of industrial production, which express output as percentages of 1977 output. The capacity estimates are expressed as percentages of 1977 output as well. Capacity utilization percentages are calculated as ratios of production to capacity. The capacity indexes are based on a variety of data, including capacity data in physical units compiled by trade associations, private and government surveys of capacity growth and utilization rates, and estimates of capital stock growth. The concept of practical capacity is applied, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work pattern, taking account of normal downtime, and assuming sufficient availability of inputs to operate machinery and equipment in place. When the capacity indexes for individual industries are aggregated—for example to total manufacturing—no explicit account is taken of possible general equilibrium constraints such as emerging industry bottlenecks. Because of the large and heterogeneous database, changes in utilization rates may be more meaningful in the analysis of business conditions than any particular level of these rates.

**Groupings.** Estimates of capacity and industrial production for manufacturing industries are aggregated to primary processing and advanced processing industries, to durable and nondurable manufacturing industries, and to total manufacturing. The mining, manufacturing, and utilities estimates aggregate to the total index. Primary processing includes textile mill products, paper and products, industrial chemicals, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metal products, and stone, clay, and glass products. Advanced processing includes foods, tobacco products, apparel products, printing and publishing, chemical products such as drugs and toiletries, leather and products, furniture and fixtures, machinery, transportation equipment, instruments, miscellaneous manufactures, and government-owned-and-operated ordnance facilities. Industrial materials are items produced and used as inputs by manufacturing plants, mines, and utilities. Industrial materials include many of the items included in the primary processing grouping of manufacturing, as well as some of the output of the advanced processing industries, mines, and utilities—such as iron ore, crude oil, semiconductors, and electricity sold to industry.

**Perspective.** The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent; none of the broad aggregates has ever reached 100 percent. For mining, manufacturing, and utilities as a whole, and for total manufacturing, utilization rates as high as 90 percent have been exceeded only in wartime.

**Revisions.** The first estimates for a month are published about the 17th of the following month. These estimates may revise in each of the next three months as new data become available. After the fourth month no further revisions are undertaken until an annual or benchmark revision. The median of the revisions in the total manufacturing utilization rate between the first and fourth estimate is 0.3 of a percentage point; that is, in about half of the cases, the absolute value of the revision from the first to the fourth estimate is less than 0.3 of a percentage point.

**Sources.** The basic methodology used to estimate the series is discussed in "Revised Federal Reserve Rates of Capacity Utilization", *Federal Reserve Bulletin*, October 1985. Revised data from 1948-84 are included in the statistical supplement to the July 1985 capacity utilization release, which may be obtained from Publications Services, Board of Governors of the Federal Reserve System, Washington, D.C. 20551

**Rounding.** Utilization rates are calculated from unrounded capacity and production indexes. Aggregates are derived from unrounded detailed components.

**Release schedule for 1986.** Approximately 11 a.m. on January 17, February 18, March 17, April 16, May 16, June 16, July 16, August 18, September 17, October 17, November 17, and December 17.
