CAPACITY UTILIZATION

Manufacturing, Mining, Utilities, and Industrial Materials

December 17, 1984

Capacity utilization in manufacturing, mining, and utilities edged up 0.1 percentage point in November to 81.5 percent--following three consecutive months of decline in the index. Utilization rates turned up in both manufacturing and mining. The rate for utilities remained at 83.0 percent in November, after having declined since June.

The November increase in the manufacturing utilization rate reflected gains in durable manufacturing. In particular, the motor vehicles and parts industry had a sharp rise in utilization after a strike-related downturn and reached its highest rate since May 1979. However, there were declines in utilization among other producers of durable goods. These included declines of one-half a percentage point or more in utilization rates in fabricated metal products, nonelectrical machinery, and aerospace and miscellaneous transportation equipment. Even so, the rates for these three industries remained above their second quarter 1984 levels. The utilization rate in nondurable manufacturing remained unchanged in the last three months.

The utilization rate in materials production edged up to 81.5 percent in November. Rates for both durable goods materials and energy materials rose, after dipping in October, while the nondurable goods materials stayed unchanged.

Capacity Utilization: Summary

Percent of capacity, seasonally adjusted

Series	1973 HIGH	1975 LOW	1978 -80 HIGH	1982 LOW	1987 -82 AVER.	1984			
						AUG	SEP	OCT	NOV
Total Industry	88.4	71.1	87.3	69.6	82.4.	82.5	81.9	81.4	81.5

Definition. This release contains estimates of output, capacity, and capacity utilization for the nation's factories, mines, and electric and gas utilities. Estimates of actual output and capacity output are expressed as percentages of 1967 actual output. Estimates of capacity utilization are calculated as ratios, in percent, of the Federal Reserve's seasonally adjusted indexes of industrial production to the indexes of capacity. The capacity indexes are based on a variety of data, including capacity data in physical units, surveys of capacity growth and utilization rates, and estimates of capital stock growth. Instead of a formal definition of capacity the concept of practical capacity is applied, which is the greatest level of output that a plant can maintain within the framework of a realistic work pattern, taking account of normal downtime, and assuming sufficient availability of inputs to operate machinery and equipment in place. When the capacity indexes for individual industries are aggregated—for example to total manufacturing—no explicit account is taken of possible general equilibrium constraints such as emerging industry bottlenecks.

Groupings. Estimates of capacity and industrial production for manufacturing industries are aggregated to primary processing and advanced processing industries, to durable and non-durable manufacturing industries, and to total manufacturing. The mining, manufacturing, and utilities estimates aggregate to the total index. Industrial materials are items produced and used as inputs by manufacturing plants, mines, and utilities. Industrial materials include many of the items included in the primary processing grouping of manufacturing, as well as some of the output of the advanced processing industries, mines, and utilities—such as iron ore, crude oil, semiconductors, and electricity sold to industry.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For mining, manufacturing, and utilities as a whole, and for total manufacturing, utilization rates as high as 90 percent have been exceeded only in wartime.

Revisions. The first estimates for a month are published about the 17th of the following month. These estimates may revise in each of the next three months as new data become available. After the fourth month no further revisions are undertaken until an annual or benchmark revision. The median of the revisions in the total manufacturing utilization rate between the first and fourth estimate is 0.3 of a percentage point; that is, in about half of the cases, the absolute value of the revision from the first to the fourth estimate is less than 0.3 of a percentage point.

Sources. The methodology used to estimate the series is discussed in *New Federal Reserve Measures of Capacity and Capacity Utilization*, Federal Reserve Bulletin, July 1983. Revised data from 1967–82 are included in the statistical supplement to the July 1983 capacity utilization release, which may be obtained from Publications Services, Board of Governors of the Federal Reserve System, Washington, D.C. 20551.

Rounding. The rounding algorithms applied to the capacity, output, and utilization rate series are independent. Aggregates are derived from unrounded detailed components.

Release schedule for 1985. Approximately 11 a.m. on January 16, February 19, March 18, April 17, May 16, June 17, July 17, August 16, September 16, October 17, November 18, and December 16.
