

# REVISION

**Revision - August 14, 1969 and pages attached to the release**

# FEDERAL RESERVE

## statistical release

H.6

For immediate release

August 14, 1969

Effective in the latest week ending August 6, the demand deposit component of the money supply was increased substantially due to a change in accounting procedures associated with Euro-dollar transactions. Previously, an increasing volume of such transactions resulted in increases in cash items in process of collection without increasing demand deposits. Cash items are deducted from gross deposits in computing the money supply; consequently, the net deposit concept measured in the money supply has been understated by an increasing amount in recent years. A tentative revision has been made in the data below and in the appended tables to correct for the estimated downward bias in the series from June 1967-July 1969. Further revisions will be completed in the near future, reflecting new benchmarks and changes in seasonal factors which are incorporated in the series annually.

The revised money supply series has increased in the first seven months of July at an annual rate of 4 per cent, compared to 2.4 per cent rate indicated by the old series. In the week ending August 6, the money supply averaged about \$500 million below the July level. Time and savings deposits declined further in the latest week to a level \$1.7 billion below the July average.
