

Money Stock Revisions

The attached historical data on the money stock reflect revisions to incorporate annual seasonal adjustment and benchmark changes, as well as minor definitional changes.

Definitional Changes

Two changes in the composition of the broader money stock measures have been made. First, tax-exempt money market funds which previously had been excluded from the aggregates are now included on the same basis as taxable money funds; that is, balances in general purpose and broker/dealer funds enter at the M2 level and balances in institution-only funds enter at the M3 level. This change boosted both M2 and M3 growth in 1982 by about 1/2 percentage point. Second, all IRA/Keogh balances at depository institutions and money market mutual funds are now removed from M2 and M3 and also from L. This change reduced M2 growth in 1982 by a bit more than 1 percentage point and M3 by about 1 percentage point.

Benchmark Revisions

Deposits of commercial banks, savings and loan associations and credit unions have been benchmarked to recent call reports. Deposits of commercial banks were benchmarked to the December 1981 and March, June and September 1982 call reports; data for savings and loan associations were benchmarked to the

December 1981 and June 1982 call reports; data for credit unions were benchmarked to the June and December 1981 call reports. The impact of these benchmark revisions is minimal--generally raising the level of M1 and lowering the levels of other deposits in the broader measures slightly, and affecting growth rates only marginally. In addition, the savings and small time deposit components of the broader measures have been revised to remove club accounts (including Christmas, vacation, and similar club accounts) from the small time category and include them in the savings category, while leaving the monetary aggregates unaffected.

RP's and overnight Eurodollar deposits also have been revised. The overnight and term RP series have been revised using a special survey of RP's at depository institutions and more complete information on money market mutual fund holdings of RP's. The net effect of the changes to RP's was to reduce the level of net overnight RP's and raise the level of term RP's; growth of M2 in 1982 was affected only slightly by these revisions and M3 growth was boosted a bit. The revision to the overnight Eurodollar component of M2 resulted from broadening the panel of branches of U.S. banks (previously consisting of a number of Caribbean offices) to include additional Caribbean offices as well as offices in other locations, principally London; the net impact of this change on both levels and growth rates was minor after allowing for holdings of such deposits by money market mutual funds.

Seasonal Revisions

Seasonal factors were revised using an X-11-ARIMA procedure adopted in 1982. Revisions to seasonal factors generally were larger than in recent years, because additional data for 1982 tended to confirm evolving patterns that

had been obscured by unusual circumstances associated with the credit control period of 1980. With the exception of July, growth in M1 in first months-of-quarters was lowered, especially in April and October.

For the deposit components of M1, the calculation of seasonal adjustment factors follows a procedure used in recent years to reduce the impact of distortions to deposit flows caused by shifts to ATS and NOW accounts. For transactions deposits (demand deposits plus other checkable deposits), seasonal factors were computed after removing the estimated amount of shifts from savings deposits and other sources outside M1 to rapidly growing OCD accounts during the period from November 1978 to March 1979 and during 1981 (and after applying a model-based procedure for preadjusting data during the credit control period of 1980--the same procedure that had been used the past two years in constructing seasonal factors for M1 deposits). For demand deposits, seasonal factors were computed after adding back in the amount estimated to have shifted from demand deposits to OCD accounts during late 1978, early 1979, and all of 1981. The seasonally adjusted OCD series continues to be a residual, derived by subtracting seasonally adjusted demand deposits from seasonally adjusted transactions deposits.

It may be noted that money market deposit accounts (MMDAs) continue to enter the broader monetary aggregates on a not seasonally adjusted basis; alternative procedures for seasonal adjustment of the broader measures containing MMDAs are under review.
