^{1.} Standard monthly seasonal factors are derived at the beginning of each year by applying an X-11/ARIMA-based procedure to the data through the end of the previous year.

^{2.} Concurrent monthly seasonal factors are derived each month by applying an X-11/ARIMA-based procedure to data through that month.

^{3.} Alternative monthly seasonal factors are derived using an experimental model-based procedure. This procedure uses a combination of statistical regression and time series modeling techniques to construct seasonal factors that are more sensitive than standard factors to unique characteristics of each series. These characteristics include fixed and evolving seasonal patterns, trading day effects, within-month seasonal variations, holiday effects, outlier adjustments, special events adjustments and serially correlated noise components.
