PRODUCTIVITY AND COSTS Second Quarter 2000

The Bureau of Labor Statistics of the U.S. Department of Labor reported preliminary productivity data--as measured by output per hour of all persons--for the second quarter of 2000. The preliminary seasonally adjusted annual rates of productivity change in the second quarter were:

- 6.2 percent in the business sector and
- 5.3 percent in the nonfarm business sector.

In both the business and nonfarm business sectors, productivity grew more rapidly in the second quarter than in the first quarter, when output per hour of all persons (as revised) rose 1.6 percent in the business sector and 1.9 percent in the nonfarm business sector.

In manufacturing, productivity changes in the second quarter were:

- 5.1 percent in manufacturing,
- 9.6 percent in durable goods manufacturing, and
- 0.0 percent in nondurable goods manufacturing.

Productivity rose 5.1 percent in the manufacturing sector in the second quarter as output and hours of all persons increased 7.0 percent and 1.7 percent, respectively. In the first quarter, manufacturing productivity rose 7.9 percent (as revised). Output and hours in manufacturing, which includes about 17 percent of U.S. business-sector employment, tend to vary more from quarter to quarter than data for the more aggregate business and nonfarm business sectors. Second-quarter measures are summarized in table A and appear in detail in tables 1 through 5.

The data in this release reflect the regular multi-year GDP revisions

The data in this release reflect the regular multi-year GDP revisions released by the Bureau of Economic Analysis of the U.S. Department of Commerce on July 28. They also reflect the annual benchmark revision to the BLS establishment survey data and revisions to hours series released by BLS on June 2. All employment and hours series incorporate new information on seasonal patterns. In addition, measures of output for the manufacturing sectors were revised. See Revised Measures. Appendix tables 1-6 show revised historical series.

Table A. Productivity and costs: Preliminary second-quarter 2000 measures

(Seasonally adjusted annual rates)

	Percer	nt change	from same	quarter a	year ago	
Business	5.0	6.9	1.7	4.7	1.4	-0.3
Nonfarm business	5.1	7.0	1.8	4.7	1.4	-0.4
Manufacturing	6.9	6.4	-0.4	4.9	1.6	-1.9
Durable	9.5	10.2	0.7	4.9	1.6	-4.2
Nondurable	3.8	1.6	-2.1	4.6	1.3	0.8

The data sources and methods used in the preparation of the manufacturing series differ from those used in preparing the business and nonfarm business series, and these measures are not directly comparable. Output measures for business and nonfarm business are based on measures of gross domestic product prepared by the Bureau of Economic Analysis of the U.S. Department of Commerce. Quarterly output measures for manufacturing reflect indexes of industrial production independently prepared by the Board of Governors of the Federal Reserve System. See Technical Notes for further information on data sources.

Business

From the first to the second quarter of 2000, business sector productivity increased at a 6.2-percent annual rate, as output rose 5.7 percent and hours of all persons engaged in the sector fell at a 0.4-percent annual rate. As revised, labor productivity rose 1.6 percent in the first quarter as output and hours increased 5.3 and 3.7 percent, respectively (table 1).

Hourly compensation increased 6.3 percent in the second quarter and 3.5 percent in the first quarter of 2000 (seasonally adjusted annual rates). This measure includes wages and salaries, supplements, employer contributions to employee benefit plans, and taxes. Unit labor costs, which reflect changes in both hourly compensation and productivity, edged up 0.1 percent during the second quarter, following a 1.9-percent rise in the first quarter of 2000.

Real hourly compensation, which takes into account changes in consumer prices, rose at a 2.6 percent annual rate during the second quarter of 2000 after declining 0.4 percent in the previous quarter.

The implicit price deflator for the business sector, which reflects changes in unit labor costs and unit nonlabor payments, increased 2.5 percent in the second quarter and 3.0 percent in the first quarter of 2000.

Nonfarm business

Productivity increased 5.3 percent in the nonfarm business sector during the second quarter of 2000, after rising 1.9 percent in the first quarter (table 2). Output rose 5.9 percent in the second quarter, after increasing 5.2 percent during the first quarter of 2000. Hours of all persons working in the sector increased 0.5 percent in the second quarter. This was the smallest increase in hours since the first quarter of 1996 (when they fell 0.1 percent) and followed a 3.2 percent rise in the first quarter of 2000.

Hourly compensation increased 5.3 percent in the second quarter, after posting a 3.9-percent gain in the first quarter of 2000. When the rise in consumer prices is taken into account, real hourly compensation for the second quarter of 2000 rose 1.6 percent.

Unit labor costs decreased 0.1 percent in the second quarter of 2000, after rising 1.9 percent one quarter earlier. The implicit price deflator for nonfarm business output grew 2.2 percent in the second quarter and 3.2 percent in the first quarter of 2000.

Manufacturing

Productivity increased 5.1 percent in manufacturing, as output rose 7.0 percent and hours of all persons increased 1.7 percent (seasonally adjusted annual rates). Growth in productivity, output, and hours was quite different in the durable and nondurable goods subsectors. In durable goods, productivity rose 9.6 percent, reflecting output growth of 13.3 percent and a 3.4-percent rise in hours of all persons. In nondurable goods, productivity remained unchanged in the second quarter, as output and hours both fell 0.8 percent (tables 3, 4, and 5).

Hourly compensation of all manufacturing workers increased 4.4 percent during the second quarter. This reflects growth of 3.8 percent in durable goods and 5.1 percent in nondurable goods. When the increase in consumer prices is taken into account, the real hourly compensation of all manufacturing workers rose 0.8 percent in the second quarter.

Unit labor costs in manufacturing dropped 0.7 percent in the second quarter. This marked the third consecutive quarter of falling unit labor costs for the total manufacturing sector; unit labor costs fell 3.0 percent in the first quarter of 2000 and 5.1 percent in the fourth quarter of 1999. In the second quarter of 2000, trends in unit labor costs in the two subsectors were quite different, reflecting the very different growth rates in productivity. Unit labor costs fell 5.3 percent in durable goods manufacturing and rose 5.1 percent in nondurable goods manufacturing. The increase in unit labor costs in nondurable goods manufacturing was the largest since a 5.8-percent rise was posted in the second quarter of 1993.

Revised Measures

Current and previous measures for the first quarter of 2000 for the business, nonfarm business, and manufacturing sectors are compared in table B. In the business and nonfarm business sectors, both the output and hours measures grew less than reported on June 6, based on information then available. Labor productivity growth was revised down. In manufacturing, productivity growth was revised up to reflect higher output growth and a larger drop in hours than originally reported.

Data on manufacturing output for 1997 and 1998 were revised to reflect newly available data on shipments from the U.S. Census Bureau. There also were small revisions to earlier years reflecting the incorporation of new data associated with the 1999 comprehensive revisions to the National Income and Product Accounts.

Output data for the business and nonfarm business sectors and compensation series for all sectors incorporate the revisions of the national income and product accounts produced by the Bureau of Economic Analysis, U.S. Department of Commerce. In addition, small changes have been made to the historical estimates of employment in for-profit organizations and corporations. Labor input measures have been revised further to reflect the annual benchmarking of employment levels derived from the monthly Current Employment Statistics (CES) survey that occurred on June 2. Updated seasonal adjustment factors also have been incorporated into the labor input measures. These revisions extend back to the first quarter of 1995. Appendix tables 1-6 present quarterly and annual measures for all sectors for 1995-97.

Revised measures: Nonfinancial Corporations

Productivity and cost measures for the first quarter for nonfinancial corporations also were revised to incorporate more recent information than was available on June 6. Productivity, output, employee hours, and hourly compensation grew more slowly than previously reported. Unit profits and the implicit price deflator were revised up from the preliminary estimates reported in June (table C).

Table C. Nonfinancial corporations: Previous and revised productivity and

Next release date

The next release of Productivity and Costs is scheduled for 8:30 a.m. EDT, Wednesday, Sept. 6, 2000. Revised second-quarter measures for business, nonfarm business, and manufacturing will be released at that time, along with measures for nonfinancial corporations.

TECHNICAL NOTES

Labor Hours: Hours data for the labor productivity and cost measures include hours for all persons working in the sector—wage and salary workers, the self-employed, and unpaid family workers. The primary source of hours and employment data is the BLS Current Employment Statistics (CES) program, which provides monthly survey data on the number of jobs held by wage and salary workers in nonfarm establishments. The CES also provides average weekly paid hours of production and nonsupervisory workers in these establishments. Average weekly paid hours of nonproduction and supervisory workers are estimated by the Office of Productivity and Technology. Weekly paid hours are adjusted to hours at work using the BLS Hours at Work survey, conducted for this purpose.

Data from the BLS Current Population Survey (CPS) are used for farm labor; in the nonfarm sector, the National Income and Product Accounts (NIPA) prepared by the Bureau of Economic Analysis (BEA) of the Department of Commerce and the CPS are used to measure labor input for government enterprises, proprietors, and unpaid family workers.

Output: Business sector output is an annual-weighted index constructed after excluding from gross domestic product (GDP) the following outputs: General government, nonprofit institutions, paid employees of private households, and the rental value of owner-occupied dwellings. Corresponding exclusions also are made in labor inputs. Business output accounted for about 77 percent of the value of GDP in 1996. Nonfarm business, which also excludes farming, accounted for about 76 percent of GDP in 1996.

Annual indexes for manufacturing and its durable and nondurable goods components are constructed by deflating current-dollar industry value of production data from the U.S. Bureau of the Census with deflators from the BEA. These deflators are based on data from the BLS producer price program and other sources. The industry shipments are aggregated using annual weights, and intrasector transactions are removed. Quarterly manufacturing output measures are based on the index of industrial production prepared monthly by the Board of Governors of the Federal Reserve System adjusted to be consistent with annual indexes of manufacturing sector output prepared by BLS. Durables include the following 2-digit SIC industries: Primary metal industries; fabricated metal products; nonelectrical machinery; industrial and commercial machinery and computer equipment; electronic and other electrical equipment; transportation equipment; instruments; lumber and lumber products; furniture and fixtures; stone, clay, and glass and concrete products; and miscellaneous manufactures. Nondurables include: Food and kindred products, tobacco products, textile mill products, apparel products, paper and allied products, printing and publishing, chemicals and chemical products, petroleum refining and related industries, rubber and plastic products, and leather and leather products.

Nonfinancial corporate output is an annual-weighted index constructed by excluding from GDP the following outputs: General government; nonprofit institutions; employees of private households; the rental value of owner-occupied dwellings; unincorporated business; and those corporations which are depository institutions, nondepository institutions, security and commodity brokers, insurance carriers, regulated investment offices, small business investment offices, and real estate investment trusts. Nonfinancial corporations accounted for about 53 percent of the value of GDP in 1996.

Productivity: These productivity measures describe the relationship between real output and the labor time involved in its production. They show the changes from period to period in the amount of goods and services produced per hour. Although these measures relate output to hours at work of all persons engaged in a sector, they do not measure the specific contribution of labor, capital, or any other factor of production. Rather, they reflect the joint effects of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and effort of the work force.

Information in this release will be made available to sensory-impaired individuals upon request. Voice phone: 202-691-5200; Federal Relay Service number: 1-800-877-8339.

August 8, 2000

SOURCES: Output data are from the Bureau of Economic Analysis and the Census Bureau of the U.S. Department of Commerce; the Bureau of Labor Statistics, U.S. Department of Labor; and the Federal Reserve Board. Compensation and hours data are from the Bureau of Labor Statistics and the Bureau of Economic Analysis.

RELIABILITY: Productivity and cost measures are regularly revised as more complete information becomes available. The measures are first published within 40 days of the close of the reference period; revisions appear 30 days later and second revisions after an additional 60 days. In the business sector, the third publication (second revision) of a quarterly index of output per hour of all persons has differed from the initial value by between -1.7 and +2.4 index points approximately 95 percent of the time. This interval is based on the performance of this measure between the fourth quarter of 1995 and the first quarter of 2000.

Footnotes, Tables 1-6

- (1) Wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. Except for nonfinancial corporations, where there are no self-employed, data also include an estimate of wages, salaries, and supplemental payments for the self-employed.
- (2) The change for recent quarters is based on the Consumer Price Index for all urban consumers (CPI-U). The trend from 1978-1999 is based on the Consumer Price Index research series (CPI-U-RS).
- (3) Unit nonlabor payments include profits, capital consumption allowances, interest, rental income of persons, and indirect taxes.
- (4) Current dollar output divided by the output index.
- (5) Quarterly changes: Percent change compounded at annual rate from the original data rather than index numbers. Annual changes: Percent change between annual average levels.
- (6) Unit nonlabor costs include capital consumption allowances, interest, rental income of persons, and indirect taxes. For nonfinancial corporations, rental income of persons is zero by definition.
- (7) Total unit costs are the sum of unit labor and nonlabor costs.
- (8) Unit profits include corporate profits with inventory valuation and capital consumption adjustments.
